

# National Geodetic Survey Absolute Antenna Calibrations

CORS User Forum

Andria Bilich & Gerald Mader

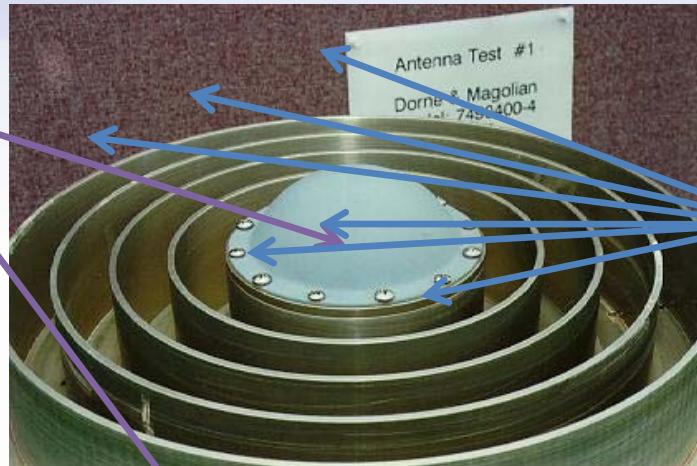

NGS Geosciences Research Division

# Outline

- Absolute calibrations
  - What are they?
  - How are they different from relative calibrations?
  - What does this mean to me?
- Calibration examples
- NGS Calibration Services

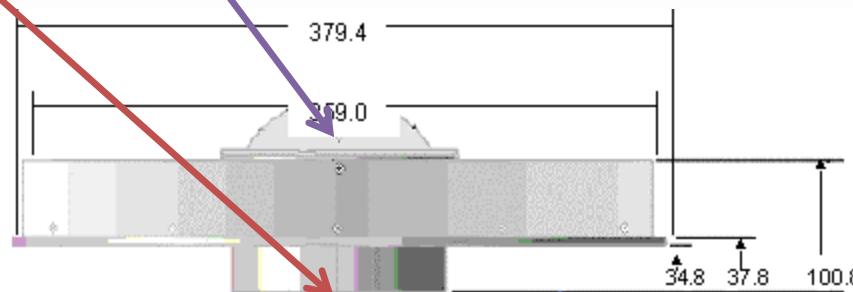

# Where do I receive the signal?

Antenna  
element

Antenna  
reference  
point  
(ARP)

Intangible  
point floating  
in space

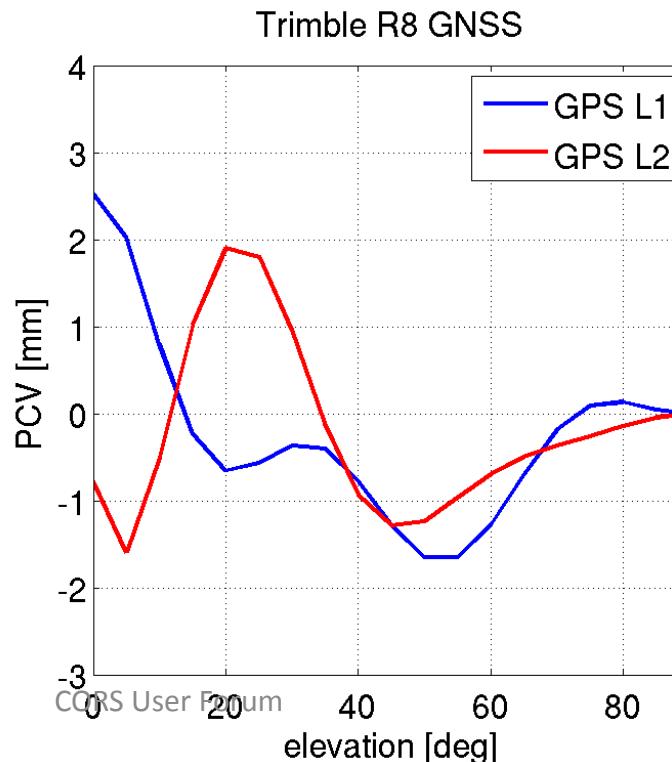

# Calibration: Map of Phase Delay/Advance

- Mean point being positioned: **PCO** (phase center offset)
- Spatial variations about the mean: **PCV** (phase center variations)
- After applying PCO & PCV, all signals converge to a single point (ARP)

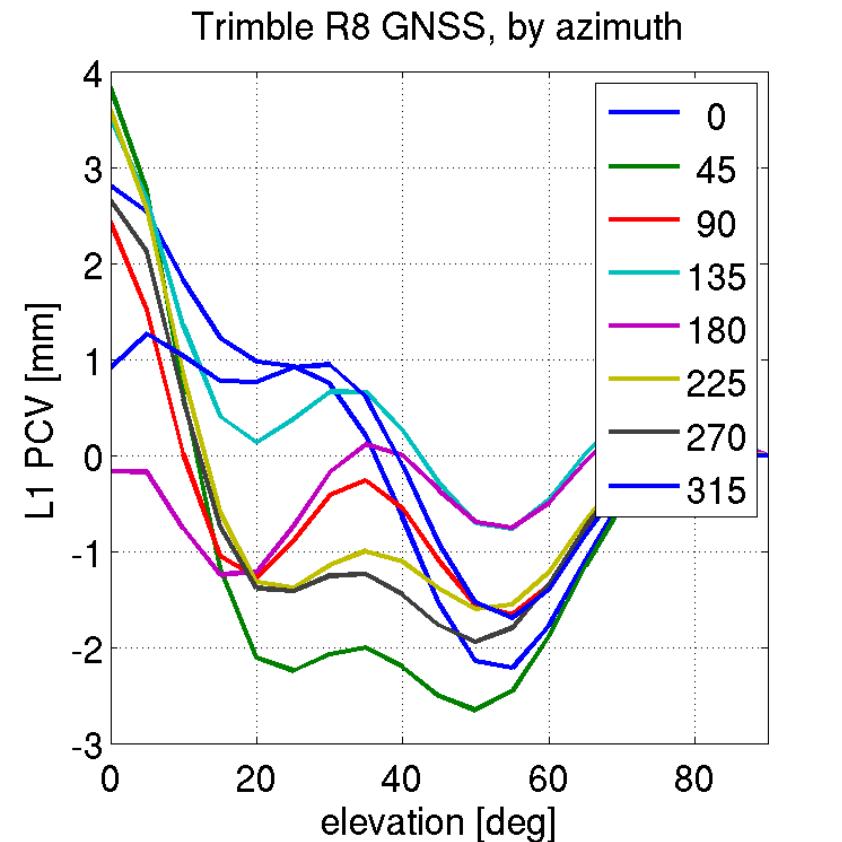

**PCO**  
[*ENU*]

**PCV**  
(*elev*)

# PCV Azimuthal Dependence

# Why Do I Need Calibrations?

- Antenna introduces elevation (and azimuth) dependent phase variation to the observed phase data -> range errors
- Input to most GNSS data processing software
- Omitting calibrations leads to estimation errors:
  - Long baselines
  - Combining multiple antenna models
- Height errors

# Relative vs. Absolute

	<b>Relative</b>	<b>Absolute</b>
Calibration values	Relative to a reference antenna (JPL chokering D/M_I)	Independent of reference antenna
Method	Stationary antennas	Test antenna moves
Advantages	Straightforward math	Sample full hemisphere and low elevation angles; independent of source
Limitations	Cannot sample full pattern; source-dependent	Requires robot and rigorous accounting of angles & rotations

Do not combine relative and absolute calibrations!

# Why Go to Absolute?

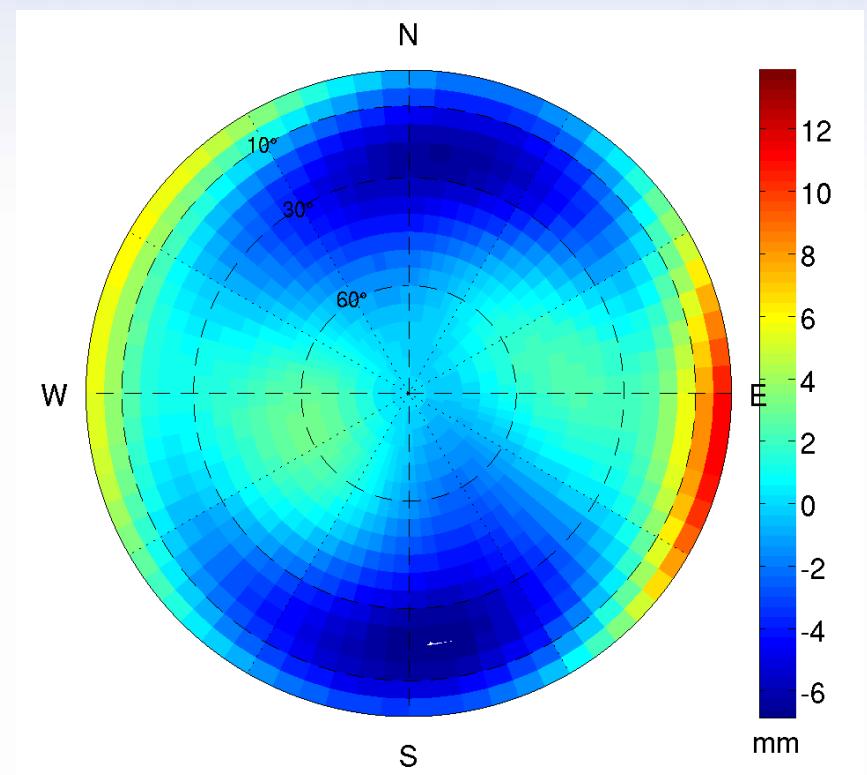

- Better/fuller description of phase behavior
  - Includes 0-10° elevation coverage
  - Captures azimuthal variations
  - Multipath removed/negated
- The way of the future
  - International GNSS Service (IGS) standard
  - Used in OPUS
  - Used in CORS multiyear [IGS08 epoch 2005.0 and NAD 83(2011) epoch 2010.0]

# NGS Absolute Calibration Motivations and Goals

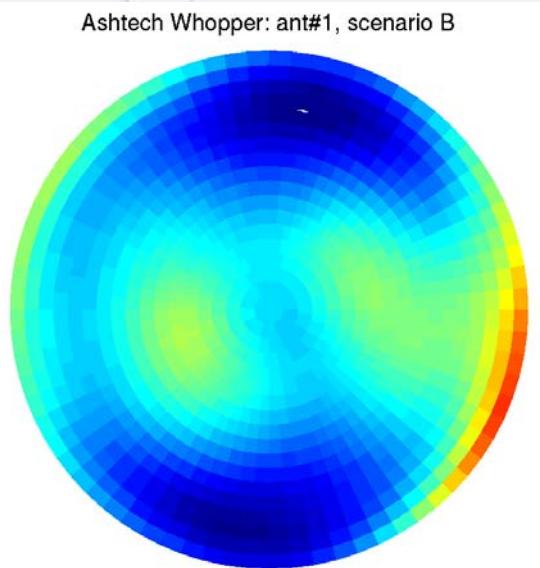

**Serve high precision needs of U.S. surveying  
and geodesy communities**

- Multi-frequency, multi-GNSS calibrations
- 2-D (elevation, azimuth) phase center patterns
- Free calibration service w/ quick turn-around
- Calibration values publicly distributed via Internet
- Compatibility with IGS ANTEX values

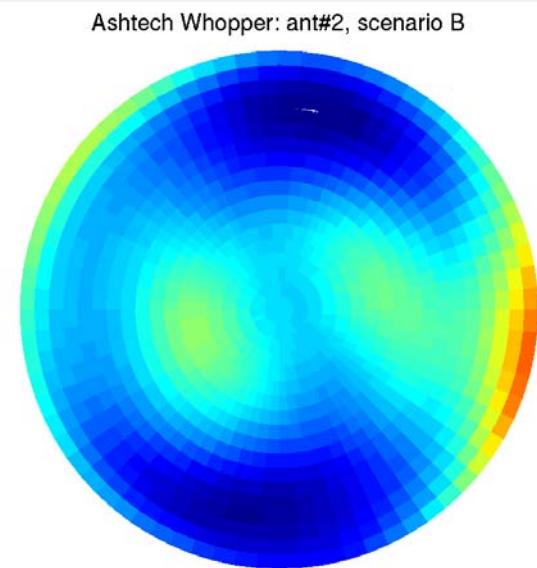

# Calibration Examples: Ashtech Whopper (ASH700718B NONE)

# *Consistency within model group: Ashtech Whopper (ASH700718B NONE)*

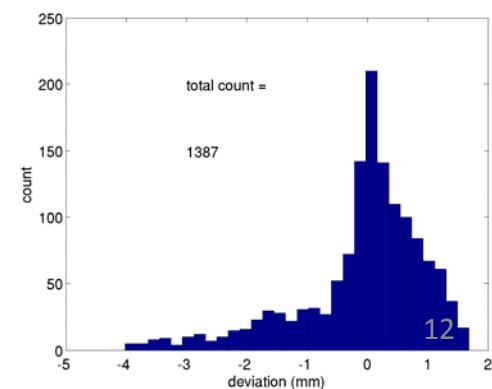

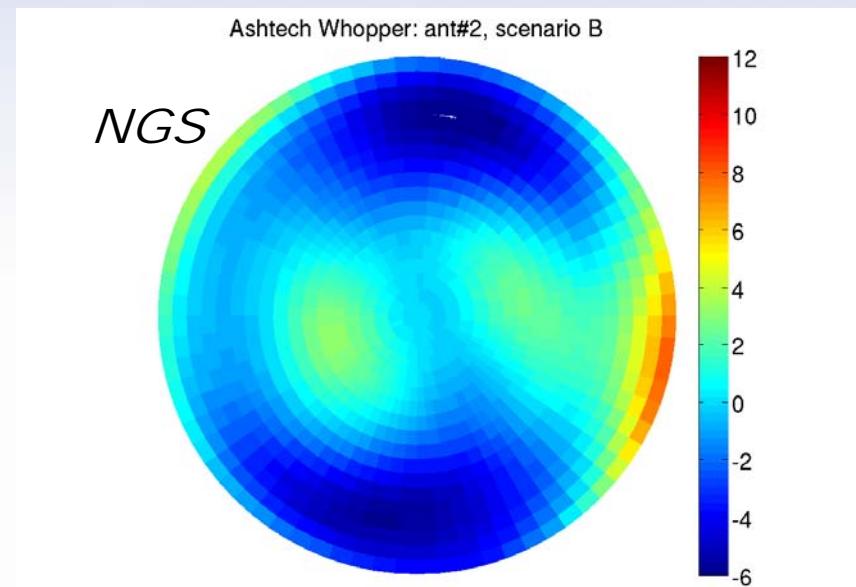

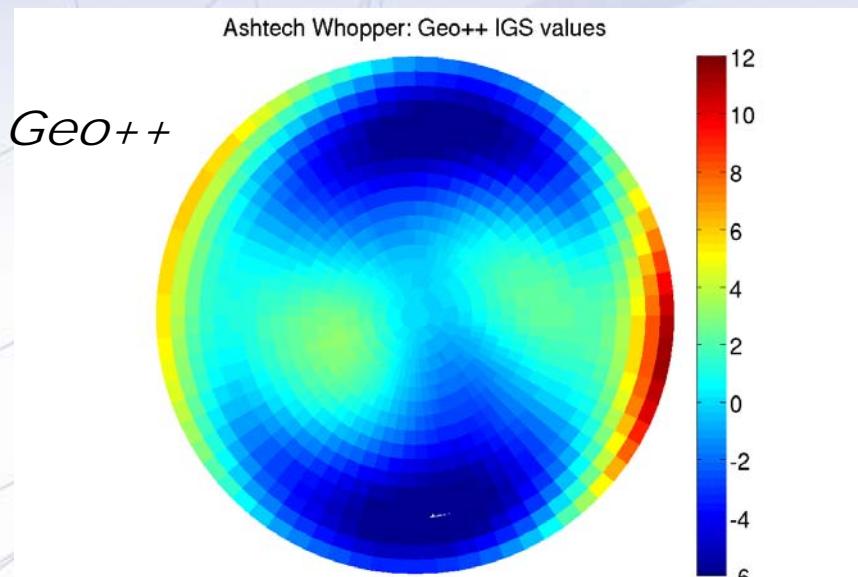

PCO =  
[-1.91 0.43 69.63] mm

PCO =  
[-1.22 0.24 70.86] mm

# Comparison to IGS: Ashtech Whopper (ASH700718B NONE)

# Conclusions and Outlook

- Pending approval from IGS Antenna Working Group
- Soon to be “open for business”
- For more information
  - <http://www.ngs.noaa.gov/ANTCAL>
  - Email [andria.bilich@noaa.gov](mailto:andria.bilich@noaa.gov) or  
[NGS.AbsAntCal@noaa.gov](mailto:NGS.AbsAntCal@noaa.gov)

FAQ

This page lists NGS's Antenna Calibrations.

Absolute Antenna Calibrations values are now the default values on this page and appear on all the antenna specific pages. These Absolute values should be used when processing data with CORS coordinates in IGS08 epoch 2005.00 and NAD 83(2011,MA11,PA11) epoch 2010.00 coordinates. These calibrations are different from earlier NGS calibrations that were relative antenna calibrations. For more information on the new CORS coordinates see:  
<http://geodesy.noaa.gov/CORS/coords.shtml>

If you are processing data with old CORS coordinates in ITRF00 epoch 1997.00 and NAD 83(CORS96, PACP00, MARP00) epoch 2002.00 you should use the Relative Antenna Calibrations available at the bottom of this page in table format only.

Composite Absolute Calibrations

- ANTEX (new IGS format)
- ANTINFO (old NGS format)

Please consult the FAQ on the left which contains additional information on the use of Absolute vs Relative Antenna Calibrations.

Composite Relative Calibrations

- ANTINFO (old NGS format)

# Formal Policy Document

- Purpose/Goal
    - Set clear expectations
    - Streamline process
  - Doc contents
    - Calibration process and stages
    - Eligibility for calibration
    - Rights and responsibilities (both NGS and antenna provider)
- Revisions expected*
- *with manufacturer input*
  - *after calibration tracking system comes online*

# Antenna Intake

- Request calibration via web form
- Tracking system
- Customer notification emails

NGS Absolute Antenna Calibrations Tracking System

Antenna Calibration Request

Returning Antenna Provider (\* mandatory) [NGS privacy policy](#)

Email\*  New Customer

New Customer? Please [Register](#)

**Antenna Information (to be calibrated)**

Select Antenna Brand that exists in NGS Database. For non-existing, select 'Other' and type

Antenna Brand\*  Other

Select Antenna Type convention for Antenna

Antenna Type  Other

IGS Antenna Type Code

Model Name  Other

Part #  Other

Primary DOF (Directional Orientation Feature)  Other

RF Connector Type  Other

Click [here](#) to email us.

**Calibration Information**

Note: Type Mean (3 - 5 antenna samples). \* (Special circumstances only)

Requested Calibration Method\*  Explain if 'Relative'

User Forum

Done

The screenshot shows a web browser window titled "Absolute Antenna Calibration - Mozilla Firefox". The main content area is titled "Absolute Antenna Calibration" and "National Geodetic Survey". Below this is a sub-section titled "NGS Absolute Antenna Calibrations Tracking System". A green bar at the top of this section is labeled "Antenna Calibration Request". Below it, there is a field for "Returning Antenna Provider" with a note "(\*) mandatory" and a link to "NGS privacy policy". An "Email" field contains "joe.smith@antenna.com" and a "New Customer" button. A link "New Customer? Please Register" is also present. The main form area starts with "Antenna Information (to be calibrated)" and a note about selecting from the NGS database or entering "Other". A dropdown menu for "Antenna Brand" is open, showing options like "Antenna Brand", "Antcom Corporation (ACC)", "AeroAntenna (AER)", etc. Other fields include "Antenna Type", "IGS Antenna Type Code", "Model Name", "Part #", "Primary DOF (Directional Orientation Feature)", "RF Connector Type", and "Calibration Information" with a note about mean values. At the bottom, there are fields for "Requested Calibration Method" and "Explain if 'Relative'", along with a "User Forum" link and a "Done" button.

# Thank You
