1. INTRODUCTION

1.1 Scope. This Interface Specification (IS) defines the requirements related to the interface between the Space Segment (SS) of the Global Positioning System (GPS) and the navigation User Segment (US) of the GPS for radio frequency (RF) link 1 (L1) and link 2 (L2).

1.2 IS Approval and Changes. The Interface Control Contractor (ICC) designated by the government is responsible for the basic preparation, approval coordination, distribution, retention, and Interface Control Working Group (ICWG) coordination of the IS in accordance with GP-03-001. The Navstar GPS Directorate (SMC/GP) is the necessary authority to make this IS effective. SMC/GP administers approvals under the auspices of the Configuration Control Board (CCB), which is governed by the appropriate GPS Directorate Operating Instruction (OI). Military organizations and contractors are represented at the CCB by their respective segment member. All civil organizations and public interest are represented by the Department of Transportation representative of the SMC/GP.

A proposal to change the approved version of this IS can be submitted by any ICWG participating organization to the GPS Directorate and/or the ICC. The ICC is responsible for the preparation of the change paper and change coordination, in accordance with GP-03-001. The ICC prepares the change paper as a Proposed Interface Revision Notice (PIRN) and is responsible for coordination of PIRNs with the ICWG. The ICWG coordinated PIRN must be submitted to the GPS Directorate CCB for review and approval.

The ICWG review period for all Proposed Interface Revisions Notices (PIRNs) is 45 days after receipt by individual addressees. A written request to extend the review period may be submitted to the ICC for consideration.

2. APPLICABLE DOCUMENTS

2.1 Government Documents. The following documents of the issue specified contribute to the definition of the interfaces between the GPS Space Segment and the GPS navigation User Segment, and form a part of this IS to the extent specified herein.

2.2 **Non-Government Documents.** The following documents of the issue specified contribute to the definition of the interfaces between the GPS Space Segment and the GPS Navigation User Segment and form a part of this IS to the extent specified herein.

Specifications

None

Other Publications

None
3. REQUIREMENTS

3.1 Interface Definition. The interface between the GPS Space Segment (SS) and the GPS navigation User Segment (US) includes two RF links, L1 and L2. Utilizing these links, the space vehicles (SVs) of the SS shall provide continuous earth coverage signals that provide to the US the ranging codes and the system data needed to accomplish the GPS navigation (NAV) mission. These signals shall be available to a suitably equipped user with RF visibility to an SV.

3.2 Interface Identification. The carriers of L1 and L2 are typically modulated by one or more bit trains, each of which normally is a composite generated by the modulo-2 addition of a pseudo-random noise (PRN) ranging code and the downlink system data (referred to as NAV data).

3.2.1 Ranging Codes. Three PRN ranging codes are transmitted: the precision (P) code which is the principal navigation ranging code; the Y-code, used in place of the P-code whenever the anti-spoofing (A-S) mode of operation is activated; and the coarse/acquisition (C/A) code which is used for acquisition of the P (or Y) code (denoted as P(Y)) and as a civil ranging signal. Code-division-multiple-access techniques allow differentiating between the SVs even though they may transmit at the same frequencies. The SVs will transmit intentionally "incorrect" versions of the C/A and the P(Y) codes where needed to protect the users from receiving and utilizing anomalous navigation signals. These two "incorrect" codes are termed non-standard C/A (NSC) and non-standard Y (NSY) codes.

For Block IIR-M, IIF, and subsequent blocks of SVs, two additional PRN ranging codes are transmitted. They are the L2 civil-moderate (L2 CM) code and the L2 civil-long (L2 CL) code. The SVs will transmit intentionally "incorrect" versions of the L2 CM and L2 CL codes where needed to protect the users from receiving and utilizing anomalous navigation signals. These "incorrect" codes are termed non-standard L2 CM (NSCM) and non-standard L2 CL (NSCL) codes. The SVs shall also be capable of initiating and terminating the broadcast of NSCM and/or NSCL code(s) independently of each other, in response to CS command.

Users shall only use non-dummy satellites as defined via current broadcast almanac. See Section 20.3.3.5.1.2.2 and/or Section 30.3.3.4 and/or Section 40.3.3.5.1.2.2 for the definition of information about the almanac.
3.2.1.1 **P-Code.** The PRN P-code for SV ID number i, for i = 1 to 37, is a ranging code, $P_i(t)$, of 7 days in length at a chipping rate of 10.23 Mbps. The 7 day sequence is the modulo-2 sum of two sub-sequences referred to as X1 and X2; their lengths are 15,345,000 chips and 15,345,037 chips, respectively. The X2, sequence is an X2 sequence selectively delayed by 1 to 37 chips thereby allowing the basic code generation technique to produce a set of 37 mutually exclusive P-code sequences of 7 days in length. Assignment of these code phase segments by SV ID number is given in Table 3-Ia. (NOTE: previous versions of this document reserved PRNs 33 through 37 for other uses. Due to increased system capability, PRNs 33 through 37 are being redesignated to allow for use by SVs.)

An initial almanac collected from P(Y)-code in the upper PRNs must be obtained from PRNs 35 or 36.

3.2.1.1.1 **Expanded P-Code (GPS III).** An expanded set of 26 P-code PRN sequences are generated by circularly shifting 26 of the original 37 sequences (over one week) by an amount corresponding to 1 day. These expanded sequences are therefore time shifted (i.e. offset) versions of 26 of the original sequences. Assignment of these expanded code phase segments by SV ID number is given in Table 3-Ib. Additional PRN P-code sequences with assigned PRN numbers are provided in Section 6.3.7, Table 6-I.

3.2.1.2 **Y-Code.** The PRN Y-code is used in place of the P-code when the A-S mode of operation is activated.

3.2.1.3 **C/A-Code.** The PRN C/A-Code for SV ID number i is a Gold code, $G_i(t)$, of 1 millisecond in length at a chipping rate of 1023 Kbps. The $G_i(t)$ sequence is a linear pattern generated by the modulo-2 addition of two sub-sequences, $G_1$ and $G_2$, each of which is a 1023 chip long linear pattern. The epochs of the Gold code are synchronized with the X1 epochs of the P-code. As shown in Table 3-Ia, the $G_2$ sequence is a G2 sequence selectively delayed by pre-assigned number of chips, thereby generating a set of different C/A-codes. Assignment of these by GPS PRN signal number are given in Table 3-Ia and Table 3-Ib.

An initial almanac collected from C/A Code in the upper PRNs must be obtained from PRNs 35, 36, or 38 through 63.

CS will prevent the simultaneous transmission of PRNs 34 and 37 of C/A code.
3.2.1.3.1 **Expanded C/A Code (GPS III).** An expanded set of 26 C/A-code PRN sequences are identified in Table 3-Ib using “G2 Delay” and “Initial G2 Setting” which is not the same as the method used in Table 3-Ia. The two-tap coder implementation method referenced and used in Table 3-Ia is not used in Table 3-Ib due to its limitation in generating C/A-code sequences. The “G2 Delay” specified in Table 3-Ib may be accomplished by using the “Initial G2 Setting” as the initialization vector for the G2 shift register of Figure 3-9. Assignment of these expanded code phase segments by SV ID number is given in Table 3-Ib. Additional PRN C/A-code sequences with assigned PRN numbers are provided in Section 6.3.7.1, Table 6-I.

3.2.1.4 **L2 CM-Code (IIR-M, IIF, and subsequent blocks).** The PRN L2 CM-code for SV ID number \(i\) is a ranging code, \(C_{\text{M},i}(t)\), which is 20 milliseconds in length at a chipping rate of 511.5 Kbps. The epochs of the L2 CM-code are synchronized with the X1 epochs of the P-code. The \(C_{\text{M},i}(t)\) sequence is a linear pattern which is short cycled every count of 10230 chips by resetting with a specified initial state. Assignment of initial states by GPS PRN signal number is given in Table 3-IIa.

3.2.1.4.1 **Expanded L2 CM Code (GPS III).** An expanded set of 26 L2 CM-Code PRN sequences are identified with assignment of initial states by SV ID number in Table 3-IIb. Additional PRN L2 CM-code sequence pairs are provided in Section 6.3.7.3, Table 6-II.

3.2.1.5 **L2 CL-Code (IIR-M, IIF, and subsequent blocks).** The PRN L2 CL-code for SV ID number \(i\) is a ranging code, \(C_{\text{L},i}(t)\), which is 1.5 seconds in length at a chipping rate of 511.5 Kbps. The epochs of the L2 CL-code are synchronized with the X1 epochs of the P-code. The \(C_{\text{L},i}(t)\) sequence is a linear pattern which is generated using the same code generator polynomial as the one used for \(C_{\text{M},i}(t)\). However, the \(C_{\text{L},i}(t)\) sequence is short cycled by resetting with a specified initial state every code count of 767250 chips. Assignment of initial states by GPS PRN signal number is given in Table 3-IIa.

3.2.1.5.1 **Expanded L2 CL-Code (GPS III).** An expanded set of 26 L2 CL-Code PRN sequences are identified with assignment of initial states by SV ID number in Table 3-IIb. Additional PRN L2 CL-code sequence pairs are provided in Section 6.3.7.3, Table 6-II.

* Short cycled period = 10230
** Short cycled period = 767250.

**NOTE #1:** There are many other available initial register states which can be used for other signal transmitters including any additional SVs in future.

**NOTE #2:** PRNs 38-63 are required per this Table if a manufacturer chooses to include these PRNs in their receiver design.
3.2.1.6 **Non-Standard Codes.** The NSC, NSCM, NSCL, and NSY codes, used to protect the user from tracking anomalous navigation signals, are not for utilization by the user and, therefore, are not defined in this document.

3.2.2 **NAV Data.** The NAV data, D(t), includes SV ephemerides, system time, SV clock behavior data, status messages and C/A to P (or Y) code handover information, etc. The 50 bps data is modulo-2 added to the P(Y)- and C/A- codes; the resultant bit-trains are used to modulate the L1 and L2 carriers. For a given SV, the data train D(t), if present, is common to the P(Y)- and C/A- codes on both the L1 and L2 channels. The content and characteristics of the NAV data, D(t), are given in Appendix II of this document for legacy NAV (LNAV) data transmitted by SVs assigned to the lower set of PRN numbers (PRN 1-32) and Appendix IV of this document for LNAV data transmitted by SVs assigned to the upper set of PRN numbers (PRN 33-63).

For Block IIR-M, Block IIF, and subsequent blocks of SVs, civil navigation (CNAV) data, D\(_C\)(t), also includes SV ephemerides, system time, SV clock behavior, status messages, etc. The D\(_C\)(t) is a 25 bps data stream which is encoded by a rate ½ convolutional encoder. When selected by ground command, the resulting 50 sps symbol stream is modulo-2 added to the L2 CM-code; the resultant bit-train is combined with L2 CL-code using chip by chip time-division multiplexing method (i.e. alternating between L2 CM \(\oplus\) data and L2 CL chips); the multiplexed bit-train is used to modulate the L2 carrier. The content and characteristics of the CNAV data, D\(_C\)(t), are given in Appendix III of this document.

During the initial period of Block IIR-M SVs operation, prior to Initial Operational Capability of L2 C signal, Block IIR-M may modulo-2 add the NAV data, D(t), to the L2 CM-code instead of CNAV data, D\(_C\)(t). Moreover, the NAV data, D(t), can be used in one of two different data rates which are selectable by ground command. D(t) with a data rate of 50 bps can be commanded to be modulo-2 added to the L2 CM-code, or D(t) with a symbol rate of 50 symbols per second (sps) (rate ½ convolutional encoding of 25 bps NAV data) can be commanded to be modulo-2 added to the L2 CM-code. The resultant bit-train is combined with L2 CL-code using chip by chip time-division multiplexing method (i.e. alternating between L2 CM \(\oplus\) data and L2 CL chips). This multiplexed bit-train is used to modulate the L2 carrier.
3.2.3 L1/L2 Signal Structure. The L1 consists of two carrier components which are in phase quadrature with each other. Each carrier component is bi-phase shift key (BPSK) modulated by a separate bit train. One bit train is the modulo-2 sum of the P(Y)-code and NAV data, D(t), while the other is the modulo-2 sum of the C/A-code and the NAV data, D(t). For Block II/IIA and IIR, the L2 is BPSK modulated by only one of those two bit trains; the bit train to be used for L2 modulation is selected by ground command. A third modulation mode is also selectable on the L2 channel by ground command: it utilizes the P(Y)-code without the NAV data as the modulating signal. For a particular SV, all transmitted signal elements (carriers, codes and data) are coherently derived from the same on-board frequency source.

For Block IIR-M, Block IIF, and subsequent blocks of SVs, the L2 consists of two carrier components. One carrier component is BPSK modulated by the bit train which is the modulo-2 sum of the P(Y)-code with or without NAV data D(t), while the other is BPSK modulated by any one of three other bit trains which are selectable by ground command. The three possible bit trains are: (1) the modulo-2 sum of the C/A-code and D(t); (2) the C/A-code with no data and; (3) a chip-by-chip time multiplex combination of bit trains consisting of the L2 CM-code with D_C(t) and the L2 CL-code with no data. The L2 CM-code with the 50 sps symbol stream of D_C(t) is time-multiplexed with L2 CL-code at a 1023 kHz rate as described in paragraph 3.2.2. The first L2 CM-code chip starts synchronously with the end/start of week epoch.

During the initial period of Block IIR-M SVs operation, prior to Initial Operational Capability of L2 C signal, Block IIR-M may modulo-2 add the NAV data, D(t), to the L2 CM-code instead of CNAV data, D_C(t). In such configuration, the data rate of D(t) may be 50 bps (i.e. without convolution encoding) or it may be 25 bps. The D(t) of 25 bps shall be convolutionally encoded resulting in 50 sps.

The different configurations and combinations of codes/signals specified in this section are shown in Table 3-III.

Notes:  
1) The configuration identified in this table reflects only the content of Section 3.2.3 and does not show all available codes/signals on L1/L2.  
2) It should be noted that there are no flags or bits in the navigation message to directly indicate which signal option is broadcast for L2 Civil (L2 C) signal.

⊕ = “exclusive-or” (modulo-2 addition)  
D(t) = NAV data at 50 bps  
D' (t) = NAV data at 25 bps with FEC encoding resulting in 50 sps  
D_C(t) = CNAV data at 25 bps with FEC encoding resulting in 50 sps

* Terminology of “in-phase” and “quadrature-phase” is used only to identify the relative phase quadrature relationship of the carrier components (i.e. 90 degrees offset of each other).  
** The two carrier components on L2 may not have the phase quadrature relationship. They may be broadcast on same phase (ref. Section 3.3.1.5).  
*** Possible signal configuration for Block IIR-M only during the initial period of Block IIR-M SVs operation, prior to Initial Operational Capability of L2 C signal. See paragraph 3.2.2.
3.3 **Interface Criteria.** The criteria specified in the following define the requisite characteristics of the SS/US interface for the L1 and L2.

3.3.1 **Composite Signal.** The following criteria define the characteristics of the composite signals.

3.3.1.1 **Frequency Plan.** For Block IIA, IIR, IIR-M, and IIF satellites, the requirements specified in this IS shall pertain to the signal contained within two 20.46 MHz bands; one centered about the L1 nominal frequency and the other centered about the L2 nominal frequency (see Table 3-Vb). For GPS III and subsequent satellites, the requirements specified in this IS shall pertain to the signal contained within two 30.69 MHz bands; one centered about the L1 nominal frequency and the other centered about the L2 nominal frequency (see Table 3-Vc). The carrier frequencies for the L1 and L2 signals shall be coherently derived from a common frequency source within the SV. The nominal frequency of this source -- as it appears to an observer on the ground -- is 10.23 MHz. The SV carrier frequency and clock rates -- as they would appear to an observer located in the SV -- are offset to compensate for relativistic effects. The clock rates are offset by $\Delta f/f = -4.4647E-10$, equivalent to a change in the P-code chipping rate of 10.23 MHz offset by a $\Delta f = -4.5674E-3$ Hz. This is equal to 10.2299999954326 MHz. The nominal carrier frequencies ($f_0$) shall be 1575.42 MHz, and 1227.6 MHz for L1 and L2, respectively.

3.3.1.2 **Correlation Loss.** The correlation loss is defined as the difference between the signal power received in the bandwidth defined in 3.3.1.1 (excluding signal combining loss) and the signal power recovered in an ideal correlation receiver of the same bandwidth using an exact replica of the waveform within an ideal sharp-cutoff filter bandwidth, whose bandwidth corresponds to that specified in 3.3.1.1 and whose phase is linear over that bandwidth.

The total allowable correlation loss due to SV modulation and filtering imperfections, which is a function of signal, shall be:

<table>

<td>0.3 dB</td>
</tr>
<tr>
<td>L1P(Y) &amp; L2P(Y)</td>
<td>0.6 dB</td>
<td>0.6 dB</td>
</tr>
</tbody>
</table>
3.3.1.3 **Carrier Phase Noise.** The phase noise spectral density of the unmodulated carrier shall be such that a phase locked loop of 10 Hz one-sided noise bandwidth shall be able to track the carrier to an accuracy of 0.1 radians rms.

3.3.1.4 **Spurious Transmissions.** In-band spurious transmissions, from the SV, shall be at or below -40 dBc over the respective bands specified in 3.3.1.1. In-band spurious transmissions are defined as transmissions within the bands specified in 3.3.1.1 which are not expressly components of the L1 and L2 signals.

3.3.1.5 **Signal Component Phasing.**

3.3.1.5.1 **Phase Quadrature.** The two L1 carrier components modulated by the two separate bit trains (C/A-code plus data and P(Y)-code plus data) shall be in phase quadrature (within ±100 milliradians) with the C/A signal carrier lagging the P signal by 90 degrees. Referring to the phase of the P carrier when \( P_i(t) \) equals zero as the "zero phase angle", the P(Y)- and C/A-code generator output shall control the respective signal phases in the following manner: when \( P_i(t) \) equals one, a 180-degree phase reversal of the P-carrier occurs; when \( G_i(t) \) equals one, the C/A carrier advances 90 degrees; when the \( G_i(t) \) equals zero, the C/A carrier shall be retarded 90 degrees (such that when \( G_i(t) \) changes state, a 180-degree phase reversal of the C/A carrier occurs). The resultant nominal composite transmitted signal phases as a function of the binary state of only the two modulating signals are as shown in Table 3-IV.

For Block IIR-M, IIF, and subsequent blocks of SVs, the two L2 carrier components shall be either in phase quadrature or in the same phase (within ±100 milliradians) - see paragraph 3.3.1.5.3 for additional information. The civil signal carrier component is modulated by any one of three (IIF) or four (IIR-M) different bit trains as described in paragraph 3.2.3. The resultant composite transmitted signal phases will vary as a function of the binary state of the modulating signals as well as the signal power ratio and phase quadrature relationship. Beyond these considerations, additional carrier components in Block IIR-M, IIF, and subsequent blocks of SVs will result in composite transmitted signal phase relationships other than the nominal special case of Table 3-IV. The current phase relationship of the two L2 carrier components (L2C and L2 P(Y)) shall be indicated by means of bit 273 of the CNAV Type 10 Message (See section 30.3.3), where zero indicates phase quadrature, with the L2C lagging the L2 P(Y) by 90 degrees, and one indicates that L2C and L2 P(Y) are in-phase. If the CNAV message is not available, then the L2C and L2 P(Y) shall be fixed in phase quadrature.
3.3.1.5.2 Phase Crosstalk. For Block IIF, the crosstalk between the C/A, when selected, and P(Y) signals shall not exceed -20 dB in the L1 and L2. The crosstalk is the relative power level of the undesired signal to the desired reference signal.

3.3.1.5.3 Phase Continuity. While the satellite is broadcasting standard C/A, P(Y), and L2C codes with data that indicates that C/A, P(Y), and L2C signal health (respectively) is OK, there will not be any commanded operation causing an intentional phase discontinuity. This does not apply to phase discontinuities caused by signal modulation. Prior to health data being available on L2C, satellites will be set unhealthy using the non-standard code.

3.3.1.6 User-Received Signal Levels. The SV shall provide L1 and L2 navigation signal strength at end-of-life (EOL), worst-case, in order to meet the minimum levels specified in Table 3-V. Any combining operation done by the SV and associated loss is compensated by an increase in SV transmitted power and thus transparent to the user segment. The minimum received power is measured at the output of a 3 dBi linearly polarized user receiving antenna (located near ground) at worst normal orientation, when the SV is above a 5-degree elevation angle. The received signal levels are observed within the in-band allocation defined in para. 3.3.1.1.

The Block IIF SV shall provide L1 and L2 signals with the following characteristic: the L1 off-axis relative power (referenced to peak transmitted power) shall not decrease by more than 2 dB from the Edge-of-Earth (EOE) to nadir, nor more than 10 dB from EOE to 20 degrees off nadir, and no more than 18 dB from EOE to 23 degrees off nadir; the L2 off-axis power gain shall not decrease by more than 2 dB from EOE to nadir, and no more than 10 dB from EOE to 23 degrees off nadir; the power drop off between EOE and ±23 degrees shall be in a monotonically decreasing fashion.

The GPS III SV shall provide L1 and L2 signals with the following characteristic: the L1 off-axis relative power (referenced to peak transmitted power) shall not decrease by more than 2 dB from the Edge-of-Earth (EOE) to nadir; the L2 off-axis power gain shall not decrease by more than 2 dB from EOE to nadir; the power drop off between EOE and ±26 degrees shall be in a monotonically decreasing fashion. Additional related data is provided as supporting material in paragraph 6.3.1.

3.3.1.7 **Equipment Group Delay.** Equipment group delay is defined as the delay between the signal radiated output of a specific SV (measured at the antenna phase center) and the output of that SV's on-board frequency source; the delay consists of a bias term and an uncertainty. The bias term is of no concern to the US since it is included in the clock correction parameters relayed in the NAV data, and is therefore accounted for by the user computations of system time (reference paragraphs 20.3.3.3.1, 30.3.3.2.3). The uncertainty (variation) of this delay as well as the group delay differential between the signals of L1 and L2 are defined in the following.

3.3.1.7.1 **Group Delay Uncertainty.** The effective uncertainty of the group delay shall not exceed 3.0 nanoseconds (95% probability).

3.3.1.7.2 **Group Delay Differential.** The group delay differential between the radiated L1 and L2 signals (i.e. L1 P(Y) and L2 P(Y), L1 P(Y) and L2C) is specified as consisting of random plus bias components. The mean differential is defined as the bias component and will be either positive or negative. For a given navigation payload redundancy configuration, the absolute value of the mean differential delay shall not exceed 15.0 nanoseconds. The random plus non-random variations about the mean shall not exceed 3.0 nanoseconds (95% probability), when including consideration of the temperature and antenna effects during a vehicle orbital revolution. Corrections for the bias components of the group delay differential are provided to the US in the NAV/CNAV message using parameters designated as $T_{GD}$ (reference paragraph 20.3.3.3.3.2) and Inter-Signal Correction (ISC) (reference paragraph 30.3.3.3.1.1).

3.3.1.7.3 **Space Service Volume Group Delay Differential.** The group delay differential between the radiated L1 and L2 signals with respect to the Earth Coverage signal for users of the Space Service Volume are provided in [http://www.igs.org/products/ssv](http://www.igs.org/products/ssv).

3.3.1.8 **Signal Coherence.** All transmitted signals for a particular SV shall be coherently derived from the same on-board frequency standard. On the L1 carrier, the chip transitions of the modulating signals, C/A and L1 P(Y), and on the L2 carrier the chip transitions of L2 P(Y) and L2C, shall be such that the average time difference between the chips on the same carrier do not exceed 10 nanoseconds. The variable time difference shall not exceed 1 nanosecond (95% probability), when including consideration of the temperature and antenna effect changes during a vehicle orbital revolution. Corrections for the bias components of the time difference are provided to the US in the CNAV message using parameters designated as ISC's (reference paragraph 30.3.3.3.1.1).

3.3.1.9 **Signal Polarization.** The transmitted signal shall be right-hand circularly polarized (RHCP). For the angular range of ±13.8 degrees from nadir, L1 ellipticity shall be no worse than 1.2 dB for Block IIA and shall be no worse than 1.8 dB for Block IIR/IIR-M/IIF/GPS III SVs. L2 ellipticity shall be no worse than 3.2 dB for Block II/IIA SVs and shall be no worse than 2.2 dB for Block IIR/IIR-M/IIF and GPS III SVs over the angular range of ±13.8 degrees from nadir.
3.3.2 PRN Code Characteristics. The characteristics of the P-, L2 CM-, L2 CL-, and the C/A-codes are defined below in terms of their structure and the basic method used for generating them. Figure 3-1 depicts a simplified block diagram of the scheme for generating the 10.23 Mbps $P_i(t)$ and the 1.023 Mbps $G_i(t)$ patterns (referred to as P- and C/A-codes respectively), and for modulo-2 summing these patterns with the NAV bit train, $D(t)$, which is clocked at 50 bps. The resultant composite bit trains are then used to modulate the signal carriers.

3.3.2.1 Code Structure. For PRN codes 1 through 37, the $P_i(t)$ pattern (P-code) is generated by the modulo-2 summation of two PRN codes, $X_1(t)$ and $X_2(t - iT)$, where $T$ is the period of one P-code chip and equals $(1.023 \times 10^7)^{-1}$ seconds, while $i$ is an integer from 1 through 37. This allows the generation of 37 unique $P(t)$ code phases (identified in Table 3-Ia) using the same basic code generator.

Expanded P-code PRN sequences, $P_i(t)$ where $38 \leq i \leq 63$, are described as follows:

$$P_i(t) = P_{i-37}(t - T) \text{ where } T \text{ will equal 24 hours}$$

therefore, the equation is

$$P_i(t) = P_{i-37x}(t + i \times 24 \text{ hours}),$$

where $i$ is an integer from 64 to 210, $x$ is an integer portion of $(i-1)/37$.

As an example, the P-code sequence for PRN 38 is the same sequence as PRN 1 shifted 24 hours into a week (i.e. 1st chip of PRN 38 at beginning of week is the same chip for PRN 1 at 24 hours after beginning of week). The list of expanded P-code PRN assignments is identified in Table 3-Ib.

The linear $G_i(t)$ pattern (C/A-code) is the modulo-2 sum of two 1023-bit linear patterns, $G_1$ and $G_2$. The latter sequence is selectively delayed by an integer number of chips to produce many different $G(t)$ patterns (defined in Tables 3-Ia and 3-Ib).

The $C_{M,i}(t)$ pattern (L2 CM-code) is a linear pattern which is reset with a specified initial state every code count of 10230 chips. Different initial states are used to generate different $C_{M,i}(t)$ patterns (defined in Tables 3-IIa and 3-IIb).

The $C_{L,i}(t)$ pattern (L2 CL-code) is also a linear pattern but with a longer reset period of 767250 chips. Different initial states are used to generate different $C_{L,i}(t)$ patterns (defined in Tables 3-IIa and 3-IIb).

For a given SV ID, two different initial states are used to generate different $C_{L,i}(t)$ and $C_{M,i}(t)$ patterns.

Section 6.3.7.1 provides a selected subset of additional P-, L2 CM-, L2 CL-, and the C/A-code sequences with assigned PRN numbers.
The linear $G_i(t)$ pattern (C/A-code) is the modulo-2 sum of two 1023-bit linear patterns, $G_1$ and $G_2$. The latter sequence is selectively delayed by an integer number of chips to produce many different $G_i(t)$ patterns (defined in Table 3-I).

The $C_{M,i}(t)$ pattern (L2 CM-code) is a linear pattern which is reset with a specified initial state every code count of 10230 chips. Different initial states are used to generate different $C_{M,i}(t)$ patterns (defined in Table 3-II).

The $C_{L,i}(t)$ pattern (L2 CL-code) is also a linear pattern but with a longer reset period of 767250 chips. Different initial states are used to generate different $C_{L,i}(t)$ patterns (defined in Table 3-II).

For a given SV ID, two different initial states are used to generate different $C_{L,i}(t)$ and $C_{M,i}(t)$ patterns.

Section 6.3.7.1 provides a selected subset of additional P-, L2 CM-, L2 CL-, and the C/A-code sequences with assigned PRN numbers.

![Figure 3-1. Generation of P-, C/A-Codes and Modulating Signals](image-url)
3.3.2.2 P-Code Generation. Each $P_i(t)$ pattern is the modulo-2 sum of two extended patterns clocked at 10.23 Mbps ($X_1$ and $X_2$). $X_1$ itself is generated by the modulo-2 sum of the output of two 12-stage registers ($X_{1A}$ and $X_{1B}$) short cycled to 4092 and 4093 chips respectively. When the $X_{1A}$ short cycles are counted to 3750, the $X_1$ epoch is generated. The $X_1$ epoch occurs every 1.5 seconds after 15,345,000 chips of the $X_1$ pattern have been generated. The polynomials for $X_{1A}$ and $X_{1B}$, as referenced to the shift register input, are:

$$X_{1A}: 1 + X^6 + X^8 + X^{11} + X^{12},$$
$$X_{1B}: 1 + X^1 + X^2 + X^5 + X^8 + X^9 + X^{10} + X^{11} + X^{12}.$$  

Samples of the relationship between shift register taps and the exponents of the corresponding polynomial, referenced to the shift register input, are as shown in Figures 3-2, 3-3, 3-4 and 3-5.

The state of each generator can be expressed as a code vector word which specifies the binary sequence constant of each register as follows: (a) the vector consists of the binary state of each stage of the register, (b) the stage 12 value appears at the left followed by the values of the remaining stages in order of descending stage numbers, and (c) the shift direction is from lower to higher stage number with stage 12 providing the current output. This code vector convention represents the present output and 11 future outputs in sequence. Using this convention, at each $X_1$ epoch, the $X_{1A}$ shift register is initialized to code vector 001001001000 and the $X_{1B}$ shift register is initialized to code vector 010101010100. The first chip of the $X_{1A}$ sequence and the first chip of the $X_{1B}$ sequence occur simultaneously in the first chip interval of any $X_1$ period.

The natural 4095 chip cycles of these generating sequences are shortened to cause precession of the $X_{1B}$ sequence with respect to the $X_{1A}$ sequence during subsequent cycles of the $X_{1A}$ sequence in the $X_1$ period. Re-initialization of the $X_{1A}$ shift register produces a 4092 chip sequence by omitting the last 3 chips (001) of the natural 4095 chip $X_{1A}$ sequence. Re-initialization of the $X_{1B}$ shift register produces a 4093 chip sequence by omitting the last 2 chips (01) of the natural 4095 chip $X_{1B}$ sequence. This results in the phase of the $X_{1B}$ sequence lagging by one chip for each $X_{1A}$ cycle in the $X_1$ period.

The $X_1$ period is defined as the 3750 $X_{1A}$ cycles (15,345,000 chips) which is not an integer number of $X_{1B}$ cycles. To accommodate this situation, the $X_{1B}$ shift register is held in the final state (chip 4093) of its 3749th cycle. It remains in this state until the $X_{1A}$ shift register completes its 3750th cycle (343 additional chips). The completion of the 3750th $X_{1A}$ cycle establishes the next $X_1$ epoch which re-initializes both the $X_{1A}$ and $X_{1B}$ shift registers starting a new $X_1$ cycle.

POLYNOMIAL X2A:
\[1 + x^1 + x^3 + x^4 + x^5 + x^7 + x^8 + x^{10} + x^{11} + x^{12}\]
The $X_2$ sequences are generated by first producing an $X_2$ sequence and then delaying it by a selected integer number of chips, $i$, ranging from 1 to 37. Each of the $X_2$ sequences is then modulo-2 added to the $X_1$ sequence thereby producing up to 37 unique $P(t)$ sequences.

The $X_2A$ and $X_2B$ shift registers, used to generate $X_2$, operate in a similar manner to the $X_1A$ and $X_1B$ shift registers. They are short-cycled, $X_2A$ to 4092 and $X_2B$ to 4093, so that they have the same relative precession rate as the $X_1$ shift registers. $X_2A$ epochs are counted to include 3750 cycles and $X_2B$ is held in the last state at 3749 cycle until $X_2A$ completes its 3750th cycle. The polynomials for $X_2A$ and $X_2B$, as referenced to the shift register input, are:

$X_2A$: $1 + X^1 + X^3 + X^4 + X^5 + X^7 + X^8 + X^9 + X^{10} + X^{11} + X^{12}$, and
$X_2B$: $1 + X^2 + X^3 + X^4 + X^8 + X^9 + X^{12}$.

(The initialization vector for $X_2A$ is 100100100101 and for $X_2B$ is 010101010100).

The $X_2A$ and $X_2B$ epochs are made to precess with respect to the $X_1A$ and $X_1B$ epochs by causing the $X_2$ period to be 37 chips longer than the $X_1$ period. When the $X_2A$ is in the last state of its 3750th cycle and $X_2B$ is in the last state of its 3749th cycle, their transitions to their respective initial states are delayed by 37 chip time durations.
At the beginning of the GPS week, X1A, X1B, X2A and X2B shift registers are initialized to produce the first chip of the week. The precession of the shift registers with respect to X1A continues until the last X1A period of the GPS week interval. During this particular X1A period, X1B, X2A and X2B are held when reaching the last state of their respective cycles until that X1A cycle is completed (see Table 3-VI). At this point, all four shift registers are initialized and provide the first chip of the new week.

Figure 3-6 shows a functional P-code mechanization for the 37 unique $P_i(t)$ code phases, $1 \leq i \leq 37$. 37 unique $P(t)$ code phases. Signal component timing for these original $P(t)$ code phases is shown in Figure 3-7, while the end-of-week reset timing and the final code vector states are given in Tables 3-VI and 3-VII, respectively.

NOTE: First Chip in each sequence is output bit whose leading edge occurs simultaneously with the epoch.

3.3.2.3 C/A-Code Generation. Each G_i(t) sequence is a 1023-bit Gold-code which is itself the modulo-2 sum of two 1023-bit linear patterns, G1 and G2. The G2 sequence is formed by effectively delaying the G2 sequence by an integer number of chips. The G1 and G2 sequences are generated by 10-stage shift registers having the following polynomials as referred to in the shift register input (see Figures 3-8 and 3-9).

\[
    G1 = X^{10} + X^{3} + 1, \text{ and} \\
    G2 = X^{10} + X^{9} + X^{8} + X^{6} + X^{3} + X^{2} + 1.
\]

The initialization vector for the G1 and G2 sequences is 1111111111. The G1 and G2 shift registers are initialized at the P-coder X1 epoch. The G1 and G2 registers are clocked at 1.023 MHz derived from the 10.23 MHz P-coder clock. The initialization by the X1 epoch phases the 1.023 MHz clock to insure that the first chip of the C/A code begins at the same time as the first chip of the P-code.

The effective delay of the G2 sequence to form the G2, sequence may be accomplished by combining the output of two stages of the G2 shift register by modulo-2 addition (see Figure 3-10). However, this two-tap coder implementation generates only a limited set of valid C/A codes. Table 3-I contains a tabulation of the G2 shift register taps selected and their corresponding P-code X2, and PRN signal numbers together with the first several chips of each resultant PRN code. Timing relationships related to the C/A code are shown in Figure 3-11.

Figure 3-9. G2 Shift Register Generator Configuration
Valid for C/A PRNs 1-37. For PRNs 38-63, the G1 Register should be XOR-ed directly to the G2 Register in order to make Gi. These PRNs do not use the Phase Select Logic box for G2i generation.
Figure 3-11. C/A-Code Timing Relationships
3.3.2.4 L2 CM-/L2 CL-Code Generation. Each \( C_{M,i}(t) \) pattern (L2 CM-code) and \( C_{L,i}(t) \) pattern (L2 CL-code) are generated using the same code generator polynomial each clocked at 511.5 Kbps. Each pattern is initiated and reset with a specified initial state (defined in Table 3-II). \( C_{M,i}(t) \) pattern is reset after 10230 chips resulting in a code period of 20 milliseconds, and \( C_{L,i}(t) \) pattern is reset after 767250 chips resulting in a code period of 1.5 seconds. The L2 CM and L2 CL shift registers are initialized at the P-coder X1 epoch. The first L2 CM-code chip starts synchronously with the end/start of week epoch. Timing relationships related to the L2 CM-/L2 CL-codes are shown in Figure 3-12.

The maximal polynomial used for L2 CM- and L2 CL-codes is 1112225171 (octal) of degree 27. The L2 CM and L2 CL code generator is conceptually described in Figure 3-13 using modular-type shift register generator.
Figure 3-12. L2 CM-/L2 CL-Code Timing Relationships
POLYNOMIAL:

Figure 3-13. L2 CM/L2 CL Shift Register Generator Configuration
3.3.3 **Navigation Data.** The content and format of the LNAV data, D(t) are given in Appendices II/IV of this document. The content and format of the CNAV data, D_c(t) are given in Appendix III of this document.

3.3.3.1 **Navigation Data Modulation (L2 CM).** For Block IIR-M, Block IIF, and subsequent blocks of SVs, the CNAV bit train, D_c(t), is rate ½ encoded and, thus, clocked at 50 sps. The resultant symbol sequence is then modulo-2 added to the L2 CM-code. During the initial period of Block IIR-M SVs operation, prior to Initial Operational Capability of L2 C signal, and upon ground command, the NAV bit train, D(t), at one of two data rates, may be modulo-2 added to the L2 CM-code instead of CNAV data, D_c(t), as further described in Section 3.2.2.

3.3.3.1.1 **Forward Error Correction.** The CNAV bit train, D_c(t), will always be Forward Error Correction (FEC) encoded by a rate 1/2 convolutional code. For Block IIR-M, the NAV bit train, D(t), can be selected to be convolutionally encoded. The resulting symbol rate is 50 sps. The convolutional coding will be constraint length 7, with a convolutional encoder logic arrangement as illustrated in Figure 3-14. The G1 symbol is selected on the output as the first half of a 40-millisecond data bit period.

Twelve-second navigation messages broadcast by the SV are synchronized with every eighth of the SV's P(Y)-code X1 epochs. However, the navigation message is FEC encoded in a continuous process independent of message boundaries (i.e. at the beginning of each new message, the encoder registers illustrated in Figure 3-14 contains the last six bits of the previous message).

Because the FEC encoding convolves successive messages, it is necessary to define which transmitted symbol is synchronized to SV time, as follows. The beginning of the first symbol that contains any information about the first bit of a message will be synchronized to every eighth X1 epoch (referenced to end/start of week). The users' convolutional decoders will introduce a fixed delay that depends on their respective algorithms (usually 5 constraint lengths, or 35 bits), for which they must compensate to determine system time from the received signal. This convolutional decoding delay and the various relationships with the start of the data block transmission and SV time are illustrated in Figure 3-15.
Figure 3-14. Convolutional Encoder

Figure 3-15. Convolutional transmit/Decoding Timing Relationships
3.3.4 GPS Time and SV Z-Count. GPS time is established by the Control Segment and is referenced to Coordinated Universal Time (UTC) as maintained by the U.S. Naval Observatory (UTC (USNO)) zero time-point defined as midnight on the night of January 5, 1980/morning of January 6, 1980. The largest unit used in stating GPS time is one week defined as 604,800 seconds. GPS time may differ from UTC because GPS time shall be a continuous time scale, while UTC is corrected periodically with an integer number of leap seconds. There also is an inherent but bounded drift rate between the UTC and GPS time scales. The OCS shall control the GPS time scale to be within one microsecond of UTC (modulo one second).

The NAV data contains the requisite data for relating GPS time to UTC. The accuracy of this data during the transmission interval shall be such that it relates GPS time (maintained by the MCS of the CS) to UTC (USNO) within 90 nanoseconds (one sigma). This data is generated by the CS; therefore, the accuracy of this relationship may degrade if for some reason the CS is unable to upload data to a SV. At this point, it is assumed that alternate sources of UTC are no longer available, and the relative accuracy of the GPS/UTC relationship will be sufficient for users. Range error components (e.g. SV clock and position) contribute to the GPS time transfer error, and under normal operating circumstances (two frequency time transfers from SV(s) whose navigation message indicates a URA of eight meters or less), this corresponds to a 97 nanosecond (one sigma) apparent uncertainty at the SV. Propagation delay errors and receiver equipment biases unique to the user add to this time transfer uncertainty.

In each SV the X1 epochs of the P-code offer a convenient unit for precisely counting and communicating time. Time stated in this manner is referred to as Z-count, which is given as a binary number consisting of two parts as follows:

a. The binary number represented by the 19 least significant bits of the Z-count is referred to as the time of week (TOW) count and is defined as being equal to the number of X1 epochs that have occurred since the transition from the previous week. The count is short-cycled such that the range of the TOW-count is from 0 to 403,199 X1 epochs (equaling one week) and is reset to zero at the end of each week. The TOW-count's zero state is defined as that X1 epoch which is coincident with the start of the present week. This epoch occurs at (approximately) midnight Saturday night-Sunday morning, where midnight is defined as 0000 hours on the UTC scale which is nominally referenced to the Greenwich Meridian. Over the years the occurrence of the "zero state epoch" may differ by a few seconds from 0000 hours on the UTC scale since UTC is periodically corrected with leap seconds while the TOW-count is continuous without such correction. To aid rapid ground lock-on to the P-code signal, a truncated version of the TOW-count, consisting of its 17 most significant bits, is contained in the hand-over word (HOW) of the L1 and L2 NAV data (D(t)) stream; the relationship between the actual TOW-count and its truncated HOW version is illustrated by Figure 3-16.

b. The most significant bits of the Z-count are a binary representation of the sequential number assigned to the current GPS week (see paragraph 6.2.4).

6.2 Definitions

6.2.1 User Range Accuracy. User Range Accuracy (URA) is a statistical indicator of the GPS ranging accuracy obtainable with a specific signal and SV. URA provides a conservative RMS estimate of the user range error (URE) in the associated navigation data for the transmitting SV. It includes all errors for which the Space and Control Segments are responsible. Whether the integrity status flag is 'off' or 'on', 4.42 times URA bounds the instantaneous URE under all conditions with 1-(1e-5) per hour probability ('legacy' level of integrity assurance). When the integrity status flag is 'on', 5.73 times URA bounds the instantaneous URE under all conditions with 1-(1e-8) per hour probability ('enhanced' level of integrity assurance). Integrity properties of the URA are specified with respect to the scaled (multiplied by either 4.42 or 5.73 as appropriate) upper bound values of the URA index or to the scaled composite of the upper bound values of all component URA indexes.

Note #1: URA applies over the transmission interval that is applicable to the NAV data from which the URA is read, for the worst-case location within the satellite footprint.

Note #2: The URA for a particular signal may be represented by a single index in the NAV data or by a composite of more than one index representing components of the total URA. Specific URA indexes and formulae for calculating the total URA for each signal are defined in appendix 20 for the LNAV message and appendix 30 for the CNAV message.

Note #3: The above integrity assured probability values do not apply if: (a) an alert is issued to the users before the instantaneous URE exceeds either of the scaled URA bounds, or (b) an alert is issued to the users no more than 8.0 seconds after the instantaneous URE exceeds the 4.42 times URA bound, and (c) if the integrity status flag is 'on' and an alert is issued to the users no more than 5.2 seconds after the instantaneous URE exceeds the 5.73 times URA bound. In this context, an "alert" is defined as any indication or characteristic of the conveying signal, as specified elsewhere in this document, which signifies to users that the conveying signal may be invalid or should not be used, such as the health bits not indicating operational-healthy, broadcasting non-standard code, parity error, etc.
6.2.1.1 **User Differential Range Accuracy.** User Differential Range Accuracy (UDRA) is a statistical indicator of the GPS ranging accuracy obtainable with a specific signal and SV after the application of the associated differential corrections (DC parameters). UDRA provides a conservative RMS estimate of the differential user range errors in the navigation data for that satellite. It includes all errors for which the Space and Control Segments are responsible.

6.2.2 **SV Block Definitions.** The following block definitions are given to facilitate discussion regarding the capability of the various blocks of GPS satellites to support the SV-to-US interface.

6.2.2.1 **Developmental SVs.** The original concept validation satellites developed by Rockwell International and designated as satellite vehicle numbers (SVNs) 1-11 are termed ”Block I” SVs. These SVs were designed to provide 3-4 days of positioning service without contact from the CS. These SVs transmitted a configuration code of 000 (reference paragraph 20.3.3.5.1.4). There are no longer any active Block I SVs in the GPS constellation. The last Block I SV was decommissioned in 1995.

6.2.2.2 **Operational SVs.** The operational satellites are designated Block II, Block IIA, Block IIR, Block IIR-M, Block IIF and GPS III SVs. Characteristics of these SVs are provided below. Modes of operation for these SVs and accuracy of positioning services provided are described in paragraphs 6.3.2 through 6.3.4. These SVs transmit configuration codes as specified in paragraph 20.3.3.5.1.4. The navigation signal provides no direct indication of the type of the transmitting SV.

6.2.2.2.1 **Block II SVs.** The first block of full scale operational SVs developed by Rockwell International are designated as SVNs 13-21 and are termed ”Block II” SVs. These SVs were designed to provide 14 days of positioning service without contact from the CS.

6.2.2.2.2 **Block IIA SVs.** The second block of full scale operational SVs developed by Rockwell International are designated as SVNs 22-40 and are termed ”Block IIA” SVs. These SVs are capable of providing 60 days of positioning service without contact from the CS.

6.2.2.2.3 **Block IIR SVs.** The block of operational replenishment SVs developed by Lockheed Martin are designated as SVNs 41-61 and are termed “Block IIR” SVs. These SVs have the capability of storing at least 60 days of navigation data with current memory margins, while operating in a IIA mode, to provide positioning service without contact from the CS for that period. (Contractual requirements for these SVs specify transmission of correct data for only 14 days to support short-term extended operations while in IIA mode.) The IIR SV will provide a minimum of 60 days of positioning service without contact from the CS when operating in autonomous navigation (Autonav) mode.

6.2.2.2.4 **Block IIR-M SVs.** The subset of operational replenishment SVs developed by Lockheed Martin which are “Modernized” configuration of “Block IIR” SVs are termed “Block IIR-M”.
6.2.2.2.5 **Block IIF SVs.** The block of operational replenishment SVs developed by Boeing are designated as SVN 62-73 and are termed “Block IIF” SVs. This is the first block of operational SVs that transmit the L5 Civil signal. These SVs will provide at least 60 days of positioning service without contact from the CS.

6.2.2.2.6 **GPS III SVs.** The block of operational replenishment SVs are designated as SVN 74-105. This is the first block of operational SVs that transmit the L1C signal. These SVs will provide at least 60 days of positioning service without contact from the CS.

6.2.3 **Operational Interval Definitions.** The following three operational intervals have been defined. These labels will be used to refer to differences in the interface definition as time progresses from SV acceptance of the last navigation data upload.

6.2.3.1 **Normal Operations.** The SV is undergoing normal operations whenever the fit interval flag (reference paragraph 20.3.3.4.3.1) is zero.

6.2.3.2 **Short-term Extended Operations.** The SV is undergoing short-term extended operations whenever the fit interval flag is one and the IODE (reference paragraph 20.3.4.4) is less than 240.

6.2.3.3 **Long-term Extended Operations.** The SV is undergoing long-term extended operations whenever the fit interval flag is one and the IODE is in the range 240-255.

6.2.4 **GPS Week Number.** The GPS week numbering system is established with week number zero (0) being defined as that week which started with the X1 epoch occurring at midnight UTC (USNO) on the night of January 5, 1980/morning of January 6, 1980. The GPS week number continuously increments by one (1) at each end/start of week epoch without ever resetting to zero. Users must recognize that the week number information contained in the Nav Message may not necessarily reflect the current full GPS week number (see paragraphs 20.3.3.3.1.1, 20.3.3.5.1.5, 20.3.3.5.2.4, and 30.3.3.1.1.1).

6.2.5 **L5 Civil Signal.** L5 is the GPS downlink signal at a nominal carrier frequency of 1176.45 MHz. The L5 signal is only available on Block IIF and subsequent blocks of SVs and the signal is specified/described in interface specification IS-GPS-705.

6.3 **Supporting Material.**

6.3.1 **Received Signals.** The guaranteed minimum user-received signal levels are defined in paragraph 3.3.1.6. As additional supporting material, Figure 6-1 illustrates an example variation in the minimum received power of the near-ground user-received L1 and L2 signals from Block II/IIA/IIR SVs as a function of SV elevation angle.

Higher received signals levels can be caused by such factors as SV attitude errors, mechanical antenna alignment errors, transmitter power output variations due to temperature variations, voltage variations and power amplifier...
variations, and due to a variability in link atmospheric path loss. For Block II/IA and IIR SVs, the maximum received signal levels as a result of these factors is not expected to exceed -155.5 dBW and -153.0 dBW, respectively, for the P(Y) and C/A components of the L1 channel, nor -158.0 dBW for either signal on the L2 channel. For Block IIR-M and IIF SVs, the maximum received signal levels as a result of these factors is not expected to exceed -155.5 dBW and -153.0 dBW, respectively, for the P(Y) and C/A components of the L1 channel and L2 channel. In addition, due to programmable power output capabilities of Block IIR-M and IIF SVs, under certain operational scenarios, individual signal components of Block IIR-M/IIF SVs may exceed the previously stated maximum but are not expected to exceed -150 dBW.
Figure 6-1. User Received Minimum Signal Level Variations (Example, Block II/IIA/IIR)
6.3.2 **Extended Navigation Mode (Block II/IIA).** The Block II and IIA SVs are capable of being uploaded by the CS with a minimum of 60 days of navigation data to support a 60 day positioning service. Due to memory retention limitations, the Block II SVs may not transmit correct data for the entire 60 days but are guaranteed to transmit correct data for at least 14 days to support short-term extended operations. Under normal conditions the CS will provide daily uploads to each SV, which will allow the SV to maintain normal operations as defined in paragraph 6.2.3.1 and described within this IS. During normal operations, the SVs will have a user range error that is at or below a level required to support a positioning accuracy of 16 meters spherical error probable (SEP). In addition, the almanac data, UTC parameters and ionospheric data will be maintained current to meet the accuracy specified in this IS.

If the CS is unable to upload the SVs (the CS is unavailable or the SV is unable to accept and process the upload), each SV will individually transition to short-term extended operations and eventually to long-term extended operations (based on time from each SV’s last upload) as defined in paragraphs 6.2.3.2 and 6.2.3.3, and as further described throughout this IS. As time from upload continues through these three operational intervals, the user range error of the SV will increase, causing a positioning service accuracy degradation. The rate of accuracy degradation is slow over the short-term extended operations interval, such that at the end of this interval (approximately 14 days after upload) the US will be able to achieve a positioning accuracy of 425 meters SEP. The rate of accuracy degradation increases in the long-term extended interval, such that by the 180th day after the last upload, the positioning errors will have grown to 10 kilometers SEP. During these intervals the URA will continue to provide the proper estimate of the user range errors.

During short-term and long-term extended operations (approximately day 2 through day 62 after an upload), the almanac data, UTC parameters and ionospheric data will not be maintained current and will degrade in accuracy from the time of last upload.

6.3.3 **Block IIA Mode (Block IIR/IIR-M).** The Block IIR/IIR-M SVs, when operating in the Block IIA mode, will perform similarly to the Block IIA SVs and have the capability of storing at least 60 days of navigation data, with current memory margins, to provide positioning service without contact from the CS for that period (through short-term and long-term extended operations). (Contractual requirements for these SVs specify transmission of correct data for only 14 days to support short-term extended operations while in IIA mode.) Under normal conditions, the CS will provide daily uploads to each SV, which will allow the SV to maintain normal operations as defined in paragraph 6.2.3.1 and described within this IS.

If the CS is unable to upload the SVs (the CS is unavailable or the SV is unable to accept and process the upload), each SV will individually transition to short-term extended operations and eventually to long-term extended operations (based on time from each SV’s last upload) as defined in paragraph 6.2.3.2 and 6.2.3.3, and as further described throughout this IS. As time from upload continues through these three operational intervals, the user range error (URE) of the SV will increase, causing a positioning service accuracy degradation.
6.3.4 Extended Navigation Mode (Block II-F). The Block II-F SVs shall be capable of being uploaded by the CS with a minimum of 60 days of data to support a 60 day positioning service. Under normal conditions, the CS will provide daily uploads to each SV, which will allow the SV to maintain normal operations as defined in paragraph 6.2.3.1 and described within this IS.

If the CS is unable to upload the SVs (the CS is unavailable or the SV is unable to accept and process the upload), each SV shall individually transition to short-term extended operations and eventually to long-term extended operations (based on time from each SV’s last upload) as defined in paragraph 6.2.3.2 and 6.2.3.3, and as further described throughout this IS. As time from upload continues through these three operational intervals, the user range error (URE) of the SV will increase, causing a positioning service accuracy degradation.

6.3.5 Extended Navigation Mode (GPS III). The GPS III SVs shall be capable of being uploaded by the CS with a minimum of 60 days of data to support a 60 day positioning service. Under normal conditions, the CS will provide daily uploads to each SV, which will allow the SV to maintain normal operations as defined in paragraph 6.2.3.1 and described within this IS.

If the CS is unable to upload the SVs (the CS is unavailable or the SV is unable to accept and process the upload), each SV shall individually transition to short-term extended operations and eventually to long-term extended operations (based on time from each SV’s last upload) as defined in paragraph 6.2.3.2 and 6.2.3.3, and as further described throughout this IS. As time from upload continues through these three operational intervals, the user range error (URE) of the SV will increase, causing a positioning service accuracy degradation.

6.3.6 Autonomous Navigation Mode. The Block IIR/IIR-M, Block IIF, and directional crosslink-capable GPS III SV in conjunction with a sufficient number of other Block IIR/IIR-M, Block IIF or directional crosslink-capable GPS III SVs, operates in an Autonav mode when commanded by the CS. Each Block IIR/IIR-M/IIF/directional crosslink-capable GPS III SV in the constellation determines its own ephemeris and clock correction parameters via SV-to-SV ranging, communication of data, and on-board data processing which updates data uploaded by the CS.

In the Autonav mode the Block IIR/IIR-M/IIF/directional crosslink-capable GPS III SV will maintain normal operations as defined in paragraph 6.2.3.1 and as further described within this IS, and will have a URE of no larger than 6 meters, one sigma for Block IIR/IIR-M. URE of 6 meters, one sigma, is expected to support 16 meter SEP accuracy under a nominal position dilution of precision. If the CS is unable to upload the SVs, the Block IIR/IIR-M/IIF/directional crosslink-capable GPS III SVs will maintain normal operations for period of at least 60 days after the last upload.

In the Autonav mode, the almanac data, UTC parameters and ionospheric data are still calculated and maintained current by the CS and uploaded to the SV as required. If the CS is unable to upload the SVs, the almanac data, UTC parameters and ionospheric data will not be maintained current and will degrade in accuracy from the time of the last upload.
6.3.7 **Additional PRN Code Sequences.** The additional PRN sequences provided in this section are for information only. The additional PRN sequences identified in this section are not applicable to GPS SVs. In addition, the current valid ranges for GPS PRN signal number for C/A- and P-code are 1-37 and 38-63 as specified in Table 3-Ia and Table 3-Ib. The PRN sequences provided in this section are for other L1/L2 signal applications, such as Satellite Based Augmentation System (SBAS) satellite signals.

6.3.7.1 **Additional C/A-code PRN sequences.** The PRN C/A-code is described in Section 3.2.1.3 and 62 unique C/A-code sequences are assigned by SV ID number in Tables 3-Ia and 3-Ib. An additional set of 147 C/A-code PRN sequences are selected and assigned with PRN numbers in this section as shown in Table 6-I.

Among the 147 additional sequences; PRN numbers 120 through 158 are reserved for SBAS; PRN numbers 64 through 119 and PRN numbers 159 through 210 are reserved for other Global Navigation Satellite System (GNSS) applications.

For GPS application, the CNAV data, \( D_c(t) \), will be modulo-2 added to the C/A-code sequences of PRN numbers 38 through 63.

Any assignment of a C/A-code PRN number and its code sequence for any additional SV and/or other L1/L2 signal applications, such as SBAS satellite signals, will be selected from the sequences of Table 6-I and will be approved, controlled, and managed by the GPS Directorate.

It should be noted that, in Table 6-I, the C/A-code sequences are identified by “G2 Delay” and “Initial G2 Setting” which are not the same as the method used in Table 3-Ia. The two-tap coder implementation method referenced and used in Table 3-Ia is not used in Table 6-I due to its limitation in generating C/A-code sequences. The “G2 Delay” specified in Table 6-I may be accomplished by using the “Initial G2 Setting” as the initialization vector for the G2 shift register of Figure 3-9. For higher order PRNs ( > 37) the two-tap output mask is not used and the output of the G2 register becomes tap -10 (10th tap) which is labeled as the "output" in Figure 3-9.
6.3.7.2 Additional P-Code PRN sequences. The PRN P-code set of 63 mutually exclusive sequences are described in Section 3.2.1.1, and assignment of these code segments by SV ID number is given in Tables 3-Ia and 3-Ib. An additional set of 147 P-code PRN sequences are described in this section. Among the 147 additional sequences PRN numbers 120 through 210 are reserved for other future GNSS applications. The P-code PRN numbers and their code sequences defined in Table 6-I are not for general use and will be approved, controlled, and managed by the GPS Directorate.

6.3.7.2.1 Additional P-code Generation. The generation of 37 mutually exclusive P-code PRN sequences are described in Section 3.3.2.2. An additional set of 147 P-code PRN sequences are generated by circularly shifting each of the original 37 sequences (over one week) by an amount corresponding to 1, 2, 3, 4, or 5 days. The additional sequences are therefore time shifted (i.e. offset) versions of the original 37 sequences. These offset P-code PRN sequences, \( p_i(t) \), are described as follows:

\[
p_i(t) = p_{i-37x}(t + xT),
\]

where \( i \) is an integer from 64 to 210, \( x \) is an integer portion of \( (i-1)/37 \), and \( T \) is defined to equal 24 hours.

As an example, P-code sequence for PRN 91 would be the same sequence as PRN 17 shifted 48 hours into a week (i.e. 1st chip of PRN 91 at beginning of week is the same chip for PRN 17 at 48 hours after beginning of week). The complete list of the additional P-code PRN assignments is shown in Table 6-I. Any assignment of a P-code PRN number and its code sequence for any additional SV and/or other L1/L2 signal applications will be selected from the sequences of Table 6-I.

As an example, P-code sequence for PRN 38 would be the same sequence as PRN 1 shifted 24 hours into a week (i.e. 1st chip of PRN 38 at beginning of week is the same chip for PRN 1 at 24 hours after beginning of week). The complete list of the additional P-code PRN assignments is shown in Table 6-I. Any assignment of a P-code PRN number and its code sequence for any additional SV and/or other L1/L2 signal applications will be selected from the sequences of Table 6-I.

* In the octal notation for the first 10 chips of the C/A-code or the initial settings as shown in this table, the first digit (1/0) represents a "1" or "0", respectively, for the first chip and the last three digits are the conventional octal representation of the remaining 9 chips. (For example, the first 10 chips of the C/A code for PRN Signal Assembly No. 64 are: 1101010011).

** P_{i}(t+N): P-code sequence of PRN number i shifted by N hours. See Section 6.3.7.2.1.

NOTE: The code phase assignments constitute inseparable pairs, each consisting of a specific C/A and a specific P code phase, as shown above.

* In the octal notation for the first 10 chips of the C/A-code or the initial settings as shown in this table, the first digit (1/0) represents a "1" or "0", respectively, for the first chip and the last three digits are the conventional octal representation of the remaining 9 chips. (For example, the first 10 chips of the C/A code for PRN Signal Assembly No. 64 are: 1101010011).

** P_(t+N): P-code sequence of PRN number i shifted by N hours. See Section 6.3.7.2.1.

NOTE: The code phase assignments constitute inseparable pairs, each consisting of a specific C/A and a specific P-code phase, as shown above.
6.3.7.3 **Additional L2 CM-/L2 CL-Code PRN sequences.** The PRN L2 CM-code and L2 CL-code are described in Sections 3.2.1.4 and 3.2.1.5, respectively, and 63 L2 CM-/L2 CL-code sequence pairs are assigned by SV ID number in Tables 3-IIa and 3-IIb. An additional set of 52 L2 CM-/L2 CL-code PRN sequence pairs are selected and assigned with PRN numbers in this section as shown in Table 6-II. Among the 52 additional sequences, PRN numbers 159 through 210 are reserved for other GNSS applications. PRN allocations do not exist for numbers 64 through 158 for L2 CM-/L2 CL-code. Any assignment of a L2 CM-/L2 CL-code PRN number and its code sequence pair for any additional SV and/or other L2 signal applications will be selected from the sequences of Table 6-II and will be approved, controlled, and managed by the GPS Directorate.

* Short cycled period = 10230
** Short cycled period = 767250
6.3.8 **Pre-Operational Use.** Before any new signal or group of signals (e.g., L2C, L5, M, L1C, etcetera) is declared operational, the availability of and/or the configuration of the broadcast signal or group of signals may not comply with all requirements of the relevant IS or ICD. For example, the pre-operational broadcast of L2C signals from the IIR-M satellites did not include any NAV or CNAV data as required by IS-GPS-200. Pre-operational use of any new signal or group of signals is at the user's own risk.

6.4 **Operational Protocols.**

6.4.1 **Lower PRN Numbers Versus Upper PRN Numbers** Many existing user receivers are only compatible with prior versions of this IS where the PRN numbers and corresponding PRN code sequences were limited to the lower range of 1 - 32. To maintain backwards compatibility with these receivers (and promote backwards utility), the CS will endeavor to operate as robust a constellation as practical using just the lower range of PRN numbers. The upper range of PRN numbers (33 - 63) is intended as an enhancement for modernized receivers which are compatible with both the lower PRN numbers and the upper PRN numbers. When feasible, the CS will endeavor to operate at least one satellite using an upper PRN number to serve as a source of almanac data for satellites using the upper range of PRN numbers.

6.4.2 **PRN Number Consistency** For a given satellite, the same PRN number will be assigned to all operational signals (signals modulated by standard PRN code with data that indicates the signal health is OK).

6.4.3 **PRNs 33 and 37** PRN 33 should not be used by satellites because of its prior use in specialized ground applications. PRN 37 should not be used by satellites until after PRN 37 is no longer needed for SATZAP purposes.

6.4.4 **PRNs 33 through 63** The CS must ensure that satellites broadcasting PRNs 33 through 63 are synchronized to GPS time to avoid conflict with specialized ground applications.

6.4.5 **Health Code Setting of ‘11110’** For backward compatibility reasons, the SV signal component health code setting of ‘11110’ is anticipated for potential use only with satellites broadcasting PRNs 33 through 63.
10. APPENDIX I. LETTERS OF EXCEPTION

10.1 **Scope.** Approval of this document, as well as approval of any subsequent changes to the document, can be contingent upon a "letter of exception". This appendix depicts such "letters of exception" when authorized by the GPS Directorate.

10.2 **Applicable Documents.** The documents listed in Section 2.0 shall be applicable to this appendix.

10.3 **Letters of Exception.** Any letter of exception which is in force for the revision of the IS is depicted in Figure 10.3-1 - 10.3-8.

Attention: Mr. David Smith

Subject: GPS Block IIR Modernization Contract F04701-00-C-0006
        Review and approval of ICD-GPS-PIRN-200C-007B, dated 08 November 2003, post 9
        April 2003 CCB (L2C = -160).

Reference: 1) PCOL# 01-012, dated 22 May 03; F04701-00-C-0006: REQUEST FOR IMPACTS
           DUE TO IMPLEMENTING PROPOSED CHANGES TO PIRN-200C-007
           REVISION B

Dear Mr. Smith:

Lockheed Martin Space Systems Company has been asked to review and comment on changes made to
ICD-GPS-PIRN-200C-007B at the JPO CCB boarded on or about 09 April 2003. It is our understanding
that the ONLY change made to the 08 November 2002 of the subject ICD is L2C for IIR-M SVs changed
from -161.4 dBW to -160.0 dBW.

Based on that change, Lockheed Martin takes exception to IIR-M L2 C signal power specified in Table 3-
III. Per Lockheed Martin contract requirements as specified in SS-SS-500, Rev. A, dated 14 May 2001,
LM55C calculates links using:

- 0-dBt circularly polarized user receiving antenna (located) near ground when the SV is above a 5°
  elevation angle
- Atmospheric loss of 0.5 dB at edge of earth
- Assumes SV antennas gains are averaged about azimuth

Using the assumptions as specified in paragraph 3.3.1.6 of PIRN-200C-007B, the GPS IIRM SVs provide
a minimum receive signal of -161.4 dBW for L2 C signal. Lockheed Martin therefore takes exception to
-160 dBW for L2C of PIRN-200C-007B. Formal request for cost and schedule impacts should come
through the JPO Contracting Officer.

To change from -161.4 dBW to -160.0 dBW would have to be analyzed and coordinated between
Lockheed Martin and ITT. If such a change were technically possible, there would be impacts to L-Band
level testing, SV level testing, test scripts, Specs, OOH, and various ICDs. These impacts would be in
both cost and schedule.

Figure 10.3-1. Letters of Exception.
Currently, there is an ongoing effort between Lockheed Martin, Boeing, Ariac, Aerospace, and the JPO concerning signal flexibility under the ConOps study. Lockheed Martin recommends, based on the outcome and direction of this effort, that an impact to the ICD-200 changes be included in the resulting request for ROMs for Flex Power implementation.

Note that if Lockheed Martin has taken earlier exception to a change in any requirements in a previous revision of this document, Lockheed Martin continues to take exception to that change. A letter explicitly stating that the exception is no longer valid will accomplish the retraction of an exception.

Should you have any questions, please contact Marti O’Connor at (610) 354-7866 for technical concerns, or the undersigned at (610) 354-7989 for contractual matters.

Very truly yours,

LOCKHEED MARTIN CORPORATION

Lockheed Martin Space Systems Company  
Space & Strategic Missiles  
Valley Forge Operations  
F.O. Box 8535  
Philadelphia, PA 19101  

27 September 2004  
GPS IIR-CM-3923, Rev A  

ARINC  
2250 E. Imperial Highway, Suite 450  
El Segundo, CA 90245-3546  

Attention:  Mr. Soon K. Yi  

Subject:  Review of IS-GPS-200 Rev D  

Reference:  
1)  Contract F04701-89-C-0073  
2)  IS-GPS-200D, dated 09 July 2004  

Dear Mr. Yi:  

Lockheed Martin Space Systems Company has reviewed the subject version of IS-GPS-200D, dated 09 July 2004. It is Lockheed Martin’s understanding that the JPO and ARINC are in the process of incorporating major changes to ICD-200C, eliminating multiple Letters of Exception, and change the Interface Control Document to an Interface Specification (IS). With this in mind, Lockheed Martin is rescinding all previous letters of exception:  
1.  GPS IIR-CM-1046, dated 17 August 1994  
2.  GPS IIR-CM-MOD-0097, dated 08 May 2002  
3.  GPS IIR-CM-2837, dated 26 May 2003  
4.  GPS IIR-CM-MOD-0177, dated 16 March 2004  

Lockheed Martin would like to establish this correspondence for the review of IS-GPS-200 as the baseline letter of exception. Lockheed Martin is taking exception to:  

1. LCNNAV  
2.  IIR-M L2C Signal Power, as defined in Table 1-V  

The original Letter of Exception, dated 09 September 2004 listed IOIC as an exception. Lockheed Martin has been able to verify this exception no longer exists. This revision to the LOE should therefore be used instead. Specific reasoning for these exceptions is documented in the attached table.  

Lockheed Martin is also submitting technical comments identified herein. If this document is approved at JPO CCB, LMSSC will expect a letter from JPO requesting cost and schedule impacts to implement these out-of-scope requirements on the IIR and IIR-M contracts.  

Per discussions with ARINC, telecons with the JPO, and the IS-200D review directions, it is Lockheed Martin’s understanding that the once this document is Configuration Controlled by the JPO, ICD-200 will be removed from Lockheed Martin’s contract with the government and replace with IS-200. The approved IS-200 will contain this LOE and Lockheed Martin will be notified in writing as to changes that occurred as part of the CCB process for concurrence to said changes.

Figure 10.3-6. Letters of Exception (continued).
Dear Ms. Flanagan:

The IS-GPS-705A ICD defines the interface between the NAVSTAR GPS Space Segment and the NAV User Segment for L5 signals. The Boeing Company has reviewed and takes exception to the following paragraphs of IS-GPS-705A, dated 23 November 2009:

- **Section 3.3.1.1.2 Group Delay Differential**: including consideration of temperature and antenna effects impacts IF/IF requirement.
- **Section 3.3.4 Signal Coherence**: expanded scope of requirement (variable time difference) would require additional testing/verification.

Should you require any additional information, please contact Mr. Steve Colletti at (562) 797-1333 or the undersigned.

Sincerely,

Sonja Peltz

Subject: Contract F0701-96-C-0025; Global Positioning System (GPS) Block IIF, ADP 152,
Letter of Exception to IS-GPS-200E, dated 28 January 2010

Changes

Dear Ms. Flanagan:

The Boeing Company has reviewed IS-GPS-200E, dated 28 January 2010, for cost and schedule impacts.
Boeing approves IS-GPS-200E, dated 28 January 2010 with the following Exceptions. If these
exceptions are accepted, there is no cost or schedule impact.

- Section 3.3.1.2 Correlation Loss: expanded scope of requirement (variable time difference)
  would require additional testing/verification
- Section 3.3.1.8 Signal Coherence: revised wording of requirement would require additional
  analysis/verification
- Section 3.3.1.5.1 Phase Quadrature: expanded scope of requirement (+/-100 milliradians)
  would require additional testing/verification. Additionally, Bit 273 (Integrity Status Flag) change
  leaves a CS requirement.
- Section 3.3.1.7.2 Group Delay Differential: including consideration of temperature and
  antenna affects impacts IIF SV requirement
- Section 20.3.3.1.3 SV Accuracy: expanded scope of requirement (URA Integrity
  Properties) is out of scope to the existing IIF SV Contact
- Globally, all references to Integrity Status Flag (ISF) and Bit 273 are new requirements
  being levied on the CS

Should you require any additional information, please contact Mr. Steve Colletti at (562) 797-1333 or
the undersigned.

20. APPENDIX II. GPS NAVIGATION DATA STRUCTURE FOR LNAV DATA, D(t), FOR PRN 1-32

20.1 Scope. This appendix describes the specific legacy navigation (LNAV) data structure denoted by data ID number 2 for the lower set of PRN numbers (PRN 1-32). This data ID number, when transmitted as part of the LNAV data, shall be represented by the two-bit binary notation as 01. Data ID number 1 is no longer in use. The LNAV data structure for the lower set of PRN numbers is denoted as LNAV-L. The LNAV data structure for the upper set of PRN numbers (LNAV-U) is described in Appendix IV.

20.2 Applicable Documents.

20.2.1 Government Documents. In addition to the documents listed in paragraph 2.1, the following documents of the issue specified contribute to the definition of the NAV data related interfaces and form a part of this Appendix to the extent specified herein.

20.2.2 Non-Government Documents. In addition to the documents listed in paragraph 2.2, the following documents of the issue specified contribute to the definition of the NAV data related interfaces and form a part of this Appendix to the extent specified herein.

Specifications
None

Other Publications
None
20.3 Requirements.

20.3.1 Data Characteristics. The data stream shall be transmitted by the SV on the L1 and L2 channels at a rate of 50 bps. In addition, upon ground command, the data stream shall be transmitted by the Block IIR-M SV on the L2 CM channel at a rate of 25 bps using FEC encoding resulting in 50 sps.

20.3.2 Message Structure. As shown in Figure 20-1, the message structure shall utilize a basic format of a 1500 bit long frame made up of five subframes, each subframe being 300 bits long. Subframes 4 and 5 shall be subcommutated 25 times each, so that a complete data message shall require the transmission of 25 full frames. The 25 versions of subframes 4 and 5 shall be referred to herein as pages 1 through 25 of each subframe. Each subframe shall consist of ten words, each 30 bits long; the MSB of all words shall be transmitted first.

Each subframe and/or page of a subframe shall contain a telemetry (TLM) word and a handover word (HOW), both generated by the SV, and shall start with the TLM/HOW pair. The TLM word shall be transmitted first, immediately followed by the HOW. The HOW shall be followed by eight data words. Each word in each frame shall contain parity (reference Section 20.3.5).

Block II and IIA SVs are designed with sufficient memory capacity for storing at least 60 days of uploaded NAV data. However, the memory retention of these SVs will determine the duration of data transmission. Block IIR SVs have the capability, with current memory margin, to store at least 60 days of uploaded NAV data in the Block IIA mode and to store at least 60 days of CS data needed to generate NAV data on-board in the Autonav mode. GPS III SVs have the capability to support operation for at least 60 days without contact from the CS. Alternating ones and zeros will be transmitted in words 3 through 10 in place of the normal NAV data whenever the SV cannot locate the requisite valid control or data element in its on-board computer memory. The following specifics apply to this default action: (a) the parity of the affected words will be invalid, (b) the two trailing bits of word 10 will be zeros (to allow the parity of subsequent subframes to be valid -- reference paragraph 20.3.5), (c) if the problem is the lack of a data element, only the directly related subframe(s) will be treated in this manner, (d) if a control element cannot be located, this default action will be applied to all subframes and all subframes will indicate ID = 1 (Block II/IIA only) (i.e., an ID-code of 001) in the HOW (reference paragraph 20.3.3.2) (Block IIR/IIR-M, IIF, and GPS III SVs indicate the proper subframe ID for all subframes). Certain failures of control elements which may occur in the SV memory or during an upload will cause the SV to transmit in non-standard codes (NSC and NSY) which would preclude normal use by the US. Normal NAV data transmission will be resumed by the SV whenever a valid set of elements becomes available.

Block II/IIA SVs are uploaded with a minimum of 60 days of NAV data. However, the EAROM retentivity for Block II SVs is designed and guaranteed for only 14 days. Therefore, Block II SV memory is most likely to fail sometime during long-term extended operations after repeated write operations. In the case of memory failure, the
SV will transmit alternating ones and zeros in word 3-10 as specified in the above paragraph. The EAROM retentivity for Block IIA SVs is designed and guaranteed for at least 60 days.

The memory retentivity is guaranteed for at least 60 days for SVs subsequent to Block IIA.

Although the data content of the SVs will be temporarily reduced during the upload process, the transmission of valid NAV data will be continuous. The data capacity of specific operational SVs may be reduced to accommodate partial memory failures.

Figure 20-1. Data Format (sheet 10 of 11)
20.3.3 Message Content. The format and contents of the TLM word and the HOW, as well as those of words three through ten of each subframe/page, are described in the following subparagraphs. The timing of the subframes and pages is covered in Section 20.3.4.

20.3.3.1 Telemetry Word. Each TLM word is 30 bits long, occurs every six seconds in the data frame, and is the first word in each subframe/page. The format shall be as shown in Figure 20-2. Bit 1 is transmitted first. Each TLM word shall begin with a preamble, followed by the TLM message, the integrity status flag, one reserved bit, and six parity bits. The TLM message contains information needed by the precise positioning service (PPS) user (authorized user) and by the CS, as described in the related SS/CS interface documentation.

Bit 23 of each TLM word is the Integrity Status Flag (ISF). A "0" in bit position 23 indicates that the conveying signal is provided with the legacy level of integrity assurance. That is, the probability that the instantaneous URE of the conveying signal exceeds 4.42 times the upper bound value of the current broadcast URA index, for more than 5.2 seconds, without an accompanying alert, is less than 1E-5 per hour. A "1" in bit-position 23 indicates that the
conveying signal is provided with an enhanced level of integrity assurance. That is, the probability that the instantaneous URE of the conveying signal exceeds 5.73 times the upper bound value of the current broadcast URA index, for more than 5.2 seconds, without an accompanying alert, is less than 1E-8 per hour. The probabilities associated with the nominal and lower bound values of the current broadcast URA index are not defined.

In this context, an "alert" is defined as any indication or characteristic of the conveying signal, as specified elsewhere in this document, which signifies to users that the conveying signal may be invalid or should not be used, such as the health bits not indicating operational-healthy, broadcasting non-standard code, parity error, etc.

20.3.3.2 Handover Word (HOW). The HOW shall be 30 bits long and shall be the second word in each subframe/page, immediately following the TLM word. A HOW occurs every 6 seconds in the data frame. The format and content of the HOW shall be as shown in Figure 20-2. The MSB is transmitted first. The HOW begins with the 17 MSBs of the time-of-week (TOW) count. (The full TOW count consists of the 19 LSBs of the 29-bit Z-count). These 17 bits correspond to the TOW-count at the X1 epoch which occurs at the start (leading edge) of the next following subframe (reference paragraph 3.3.4).

Bit 18 is an "alert" flag. When this flag is raised (bit 18 = "1"), it shall indicate to the standard positioning service (SPS) user (unauthorized user) that the signal URA may be worse than indicated in subframe 1 and that he shall use that SV at his own risk.

Bit 19 is an anti-spoof (A-S) flag. A "1" in bit-position 19 indicates that the A-S mode is ON in that SV.

Bits 20, 21, and 22 of the HOW provide the ID of the subframe in which that particular HOW is the second word; the ID code shall be as follows:

<table>
<thead>
<tr>
<th>Subframe</th>
<th>ID Code</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>001</td>
</tr>
<tr>
<td>2</td>
<td>010</td>

<tr>
<td>5</td>
<td>101</td>
</tr>
</tbody>
</table>
20.3.3.3 Subframe 1. The content of words three through ten of subframe 1 are defined below, followed by related algorithms and material pertinent to use of the data.

20.3.3.3.1 Subframe 1 Content. The third through tenth words of subframe 1 shall each contain six parity bits as their LSBs; in addition, two non-information bearing bits shall be provided as bits 23 and 24 of word ten for parity computation purposes. The remaining 190 bits of words three through ten shall contain the clock parameters and other data described in the following.

The clock parameters describe the SV time scale during the period of validity. The parameters are applicable during the time in which they are transmitted. The timing information for subframes, pages, and data sets is covered in Section 20.3.4.
20.3.3.3.1.1 Transmission Week Number. The ten MSBs of word three shall contain the ten LSBs of the Week Number as defined in 3.3.4. These ten bits shall be a modulo 1024 binary representation of the current GPS week number at the start of the data set transmission interval (see paragraph 3.3.4(b)). The GPS week number increments at each end/start of week epoch. For Block II SVs in long-term extended operations, beginning approximately 28 days after upload, the transmission week number may not correspond to the actual GPS week number due to curve fit intervals that cross week boundaries.

20.3.3.3.1.2 Code(s) on L2 Channel. Bits 11 and 12 of word three shall indicate which code(s) is (are) commanded ON for the L2 channel, as follows:

- 00 = Reserved,
- 01 = P code ON,
- 10 = C/A code ON.

20.3.3.3.1.3 SV Accuracy. Bits 13 through 16 of word three shall give the URA index of the SV (reference paragraph 6.2.1) for the standard positioning service user. While the URA may vary over the ephemeris curve fit interval, the URA index (N) in the LNAV message shall correspond to the maximum URA expected over the entire ephemeris curve fit interval. Except for Block IIR/IIR-M SVs in the Autonav mode, the URA index (N) is an integer in the range of 0 through 15 and has the following relationship to the URA of the SV:

<table>
<thead>

<td>3072.00 &lt; URA ≤ 6144.00</td>
</tr>
<tr>
<td>15</td>
<td>6144.00 &lt; URA (or no accuracy prediction is available - standard positioning service users are advised to use the SV at their own risk.)</td>
</tr>
</tbody>
</table>

For each URA index (N), users may compute a nominal URA value (X) as given by:

- If the value of N is 6 or less, \( X = 2^{(1 + N/2)} \),
- If the value of N is 6 or more, but less than 15, \( X = 2^{(N - 2)} \),
- N = 15 shall indicate the absence of an accuracy prediction and shall advise the standard positioning service user to use that SV at his own risk.

For N = 1, 3, and 5, X should be rounded to 2.8, 5.7, and 11.3 meters, respectively.

For Block IIR/IIR-M SVs in the Autonav mode, the URA shall be defined to mean “no better than X meters”, with “X” as defined above for each URA index.

The nominal URA value (X) is suitable for use as a conservative prediction of the RMS signal-in-space (SIS) range errors for accuracy-related purposes in the pseudorange domain (e.g., measurement de-weighting, receiver autonomous integrity monitoring (RAIM), figure of merit (FOM) computations). Integrity properties of the URA are specified with respect to the scaled (multiplied by either 4.42 or 5.73 as appropriate) upper bound values of the URA index (see 20.3.3.1).

URA accounts for SIS contributions to user range error which include, but are not limited to, the following: LSB representation/truncation error; the net effect of clock correction polynomial error and code phase error in the transmitted signal for single-frequency L1C/A or single-frequency L2C users who correct the code phase as described in Section 30.3.3.3.1.1.1; the net effect of clock parameter, code phase, and inter-signal correction error for dual-frequency L1/L2 and L1/L5 users who correct for group delay and ionospheric effects as described in Section 30.3.3.3.1.1.2; ephemeris error; anisotropic antenna errors; and signal deformation error. URA does not
account for user range error contributions due to the inaccuracy of the broadcast ionospheric data parameters used in the single-frequency ionospheric model or for other atmospheric effects.

20.3.3.3.1.4 SV Health. The six-bit health indication given by bits 17 through 22 of word three refers to the transmitting SV. The MSB shall indicate a summary of the health of the NAV data, where

\[
\begin{align*}
0 & = \text{all NAV data are OK}, \\
1 & = \text{some or all NAV data are bad}.
\end{align*}
\]

The five LSBs shall indicate the health of the signal components in accordance with the codes given in paragraph 20.3.3.5.1.3. The health indication shall be given relative to the "as designed" capabilities of each SV (as designated by the configuration code - see paragraph 20.3.3.5.1.4). Accordingly, any SV which does not have a certain capability will be indicated as "healthy" if the lack of this capability is inherent in its design or if it has been configured into a mode which is normal from a user standpoint and does not require that capability.

Additional SV health data are given in subframes 4 and 5. The data given in subframe 1 may differ from that shown in subframes 4 and/or 5 of other SVs since the latter may be updated at a different time.

20.3.3.3.1.5 Issue of Data, Clock (IODC). Bits 23 and 24 of word three in subframe 1 shall be the two MSBs of the ten-bit IODC term; bits one through eight of word eight in subframe 1 shall contain the eight LSBs of the IODC. The IODC indicates the issue number of the data set and thereby provides the user with a convenient means of detecting any change in the correction parameters. Constraints on the IODC as well as the relationship between the IODC and the IODE (issue of data, ephemeris) terms are defined in paragraph 20.3.4.4.

Short-term and Long-term Extended Operations. Whenever the fit interval flag indicates a fit interval greater than 4 hours, the IODC can be used to determine the actual fit interval of the data set (reference section 20.3.4.4).
20.3.3.1.6 **Data Flag for L2 P-Code.** When bit 1 of word four is a "1", it shall indicate that the NAV data stream was commanded OFF on the P-code of the L2 channel.

20.3.3.1.7 **Estimated Group Delay Differential.** Bits 17 through 24 of word seven contain the L1-L2 correction term, $T_{GD}$, for the benefit of "L1 only" or "L2 only" users; the related user algorithm is given in paragraph 20.3.3.3.

20.3.3.1.8 **SV Clock Correction.** Bits nine through 24 of word eight, bits one through 24 of word nine, and bits one through 22 of word ten contain the parameters needed by the users for apparent SV clock correction ($t_0$, $a_2$, $a_1$, $a_0$). The related algorithm is given in paragraph 20.3.3.3.

20.3.3.2 **Subframe 1 Parameter Characteristics.** For those parameters whose characteristics are not fully defined in Section 20.3.3.1, the number of bits, the scale factor of the LSB (which shall be the last bit received), the range, and the units shall be as specified in Table 20-I.

20.3.3.3 **User Algorithms for Subframe 1 Data.** The algorithms defined below (a) allow all users to correct the code phase time received from the SV with respect to both SV code phase offset and relativistic effects, (b) permit the "single frequency" (L1 or L2) user to compensate for the effects of SV group delay differential (the user who utilizes both frequencies does not require this correction, since the clock parameters account for the induced effects), and (c) allow the "two frequency" (L1 and L2) user to correct for the group propagation delay due to ionospheric effects (the single frequency user may correct for ionospheric effects as described in paragraph 20.3.3.5.2.5).

* Parameters so indicated shall be two's complement, with the sign bit (+ or -) occupying the MSB;

** See Figure 20-1 for complete bit allocation in subframe;

*** Unless otherwise indicated in this column, effective range is the maximum range attainable with indicated bit allocation and scale factor.

20.3.3.3.3.1 User Algorithm for SV Clock Correction. The polynomial defined in the following allows the user to determine the effective SV PRN code phase offset referenced to the phase center of the antennas ($\Delta t_{sv}$) with respect to GPS system time ($t$) at the time of data transmission. The coefficients transmitted in subframe 1 describe the offset apparent to the two-frequency user for the interval of time in which the parameters are transmitted. This estimated correction accounts for the deterministic SV clock error characteristics of bias, drift and aging, as well as for the SV implementation characteristics of group delay bias and mean differential group delay. Since these coefficients do not include corrections for relativistic effects, the user's equipment must determine the requisite relativistic correction. Accordingly, the offset given below includes a term to perform this function.

The user shall correct the time received from the SV with the equation (in seconds)
\[ t = t_{sv} - \Delta t_{sv} \]  
\[ t \] = GPS system time (seconds),

\[ t_{sv} \] = effective SV PRN code phase time at message transmission time (seconds),

\[ \Delta t_{sv} \] = SV PRN code phase time offset (seconds).

The SV PRN code phase offset is given by

\[ \Delta t_{sv} = a_{f0} + a_{f1}(t - t_{oc}) + a_{f2}(t - t_{oc})^2 + \Delta t_r \]  
\[ \Delta t_{sv} \] where

\[ a_{f0}, a_{f1} \text{ and } a_{f2} \] are the polynomial coefficients given in subframe 1, \( t_{oc} \) is the clock data reference time in seconds (reference paragraph 20.3.4.5), and \( \Delta t_r \) is the relativistic correction term (seconds) which is given by

\[ \Delta t_r = F e^{\sqrt{A}} \sin E_k. \]

The orbit parameters \( (e, \sqrt{A}, E_k) \) used here are described in discussions of data contained in subframes 2 and 3, while \( F \) is a constant whose value is

\[ F = \frac{-2\sqrt{\mu}}{c^2} = -4.442807633 \times 10^{-10} \frac{\sec}{\sqrt{\text{meter}}}, \]

where

\[ \mu = 3.986005 \times 10^{14} \text{ meters}^3 \text{ per second}^2 \] = value of Earth’s universal gravitational parameters

\[ c = 2.99792458 \times 10^8 \text{ meters per second} \] = speed of light.

Note that equations (1) and (2), as written, are coupled. While the coefficients \( a_{f0}, a_{f1} \) and \( a_{f2} \) are generated by using GPS time as indicated in equation (2), sensitivity of \( t_{sv} \) to \( t \) is negligible. This negligible sensitivity will allow the
user to approximate t by t<sub>SV</sub> in equation (2). The value of t must account for beginning or end of week crossovers. That is, if the quantity t - t<sub>oc</sub> is greater than 302,400 seconds, subtract 604,800 seconds from t. If the quantity t - t<sub>oc</sub> is less than 302,400 seconds, add 604,800 seconds to t.

The control segment will utilize the following alternative but equivalent expression for the relativistic effect when estimating the NAV parameters:

\[
\Delta t = \frac{-2\mathbf{R} \cdot \mathbf{V}}{c^2}
\]

where

\[
\mathbf{R}
\]

is the instantaneous position vector of the SV,

\[
\mathbf{V}
\]

is the instantaneous velocity vector of the SV, and

\[
c
\]

is the speed of light. (Reference paragraph 20.3.4.3).

It is immaterial whether the vectors \(\mathbf{R}\) and \(\mathbf{V}\) are expressed in earth-fixed, rotating coordinates or in earth-centered, inertial coordinates.

20.3.3.3.3.2 L1 - L2 Correction. The L1 and L2 correction term, T<sub>GD</sub>, is initially calculated by the CS to account for the effect of SV group delay differential between L1 P(Y) and L2 P(Y) based on measurements made by the SV contractor during SV manufacture. The value of T<sub>GD</sub> for each SV may be subsequently updated to reflect the actual on-orbit group delay differential. This correction term is only for the benefit of "single-frequency" (L1 P(Y) or L2 P(Y)) users; it is necessitated by the fact that the SV clock offset estimates reflected in the \(a_{0}\) clock correction coefficient (see paragraph 20.3.3.3.3.1) are based on the effective PRN code phase as apparent with two frequency (L1 P(Y) and L2 P(Y)) ionospheric corrections. Thus, the user who utilizes the L1 P(Y) signal only shall modify the code phase offset in accordance with paragraph 20.3.3.3.3.2 with the equation

\[
(\Delta t_{SV})_{L1P(Y)} = \Delta t_{SV} - T_{GD}
\]

where T<sub>GD</sub> is provided to the user as subframe 1 data. For the user who utilizes L2 P(Y) only, the code phase modification is given by

\[
(\Delta t_{SV})_{L2P(Y)} = \Delta t_{SV} - \gamma T_{GD}
\]
where, denoting the nominal center frequencies of L1 and L2 as \( f_{L1} \) and \( f_{L2} \) respectively,

\[
\gamma = \left( \frac{f_{L1}}{f_{L2}} \right)^2 = \left( \frac{1575.42}{1227.6} \right)^2 = \left( \frac{77}{60} \right)^2.
\]

The value of \( T_{GD} \) is not equal to the mean SV group delay differential, but is a measured value that represents the mean group delay differential multiplied by \( 1/(1-\gamma) \). That is,

\[
T_{GD} = \frac{1}{1-\gamma} \left( t_{L1P(Y)} - t_{L2P(Y)} \right)
\]

where \( t_{L_iP(Y)} \) is the GPS time the \( i \)th frequency P(Y) signal (a specific epoch of the signal) is transmitted from the SV antenna phase center.

20.3.3.3.3.3 Ionospheric Correction. The two frequency (L1 P(Y) and L2 P(Y)) user shall correct for the group delay due to ionospheric effects by applying the relationship:

\[
PR = \frac{PR_{L2P(Y)} - \gamma PR_{L1P(Y)}}{1 - \gamma}
\]

where

\[
PR = \text{ pseudorange corrected for ionospheric effects,}
\]

\[
PR_i = \text{ pseudorange measured on the channel indicated by the subscript,}
\]

and \( \gamma \) is as defined in paragraph 20.3.3.3.3.2. The clock correction coefficients are based on "two frequency" measurements and therefore account for the effects of mean differential delay in SV instrumentation.
20.3.3.3.4 Example Application of Correction Parameters. A typical system application of the correction parameters for a user receiver is shown in Figure 20-3. The ionospheric model referred to in Figure 20-3 is discussed in paragraph 20.3.3.5.2.5 in conjunction with the related data contained in page 18 of subframe 4. The term referred to in Figure 20-3 is discussed in paragraph 20.3.3.5.2.6 in conjunction with the related data contained in page 13 of subframe 4.

Figure 20-3. Sample Application of Correction Parameters
20.3.3.4 Subframes 2 and 3. The contents of words three through ten of subframes 2 and 3 are defined below, followed by material pertinent to the use of the data.

20.3.3.4.1 Content of Subframes 2 and 3. The third through tenth words of subframes 2 and 3 shall each contain six parity bits as their LSBs; in addition, two non-information bearing bits shall be provided as bits 23 and 24 of word ten of each subframe for parity computation purposes. Bits 288 through 292 of subframe 2 shall contain the Age of Data Offset (AODO) term for the navigation message correction table (NMCT) contained in subframe 4 (reference paragraph 20.3.3.5.1.9). The remaining 375 bits of those two subframes shall contain the ephemeris representation parameters of the transmitting SV.

The ephemeris parameters describe the orbit during the curve fit intervals described in section 20.3.4. Table 20-II gives the definition of the orbital parameters using terminology typical of Keplerian orbital parameters; it shall be noted, however, that the transmitted parameter values are such that they provide the best trajectory fit in Earth-Centered, Earth-Fixed (ECEF) coordinates for each specific fit interval. The user shall not interpret intermediate coordinate values as pertaining to any conventional coordinate system.

The issue of ephemeris data (IODE) term shall provide the user with a convenient means for detecting any change in the ephemeris representation parameters. The IODE is provided in both subframes 2 and 3 for the purpose of comparison with the 8 LSBs of the IODC term in subframe 1. Whenever these three terms do not match, a data set cutover has occurred and new data must be collected. The timing of the IODE and constraints on the IODC and IODE are defined in paragraph 20.3.4.4.

Any change in the subframe 2 and 3 data will be accomplished with a simultaneous change in both IODE words. The CS (Block II/Block IIA/IIR-IIR-M/IIF) and SS (GPS III) shall assure that the $t_{se}$ value, for at least the first data set transmitted by an SV after an upload, is different from that transmitted prior to the cutover (reference paragraph 20.3.4.5).

A "fit interval" flag is provided in subframe 2 to indicate whether the ephemerides are based on a four-hour fit interval or a fit interval greater than four hours (reference paragraph 20.3.3.4.3.1).

The AODO word is provided in subframe 2 to enable the user to determine the validity time for the NMCT data provided in subframe 4 of the transmitting SV. The related algorithm is given in paragraph 20.3.3.4.4.

20.3.3.4.2 Subframe 2 and 3 Parameter Characteristics. For each ephemeris parameter contained in subframes 2 and 3, the number of bits, the scale factor of the LSB (which shall be the last bit received), the range, and the units shall be as specified in Table 20-III.

The AODO word (which is not an ephemeris parameter) is a five-bit unsigned term with an LSB scale factor of 900, a range from 0 to 31, and units of seconds.
20.3.3.4.3 **User Algorithm for Ephemeris Determination.** The user shall compute the ECEF coordinates of position for the phase center of the SVs’ antennas utilizing a variation of the equations shown in Table 20-IV. Subframes 2 and 3 parameters are Keplerian in appearance; the values of these parameters, however, are produced by the CS (Block II/Block IIA/IIR/IIR-M/IIF) and SS (GPS III) via a least squares curve fit of the predicted ephemeris of the phase center of the SVs’ antennas (time-position quadruples; t, x, y, z expressed in ECEF coordinates). Particulars concerning the periods of the curve fit, the resultant accuracy, and the applicable coordinate system are given in the following subparagraphs.

20.3.3.4.3.1 **Curve Fit Intervals.** Bit 17 in word 10 of subframe 2 is a "fit interval" flag which indicates the curve-fit interval used by the CS (Block II/Block IIA/IIR/IIR-M/IIF) and SS (GPS III) in determining the ephemeris parameters, as follows:

0  =  4 hours,

1  =  greater than 4 hours.

The relationship of the curve-fit interval to transmission time and the timing of the curve-fit intervals is covered in section 20.3.4.

</tbody>
</table>

20.3.4.3.2 Parameter Sensitivity. The sensitivity of the SV's antenna phase center position to small perturbations in most ephemeris parameters is extreme. The sensitivity of position to the parameters \( \sqrt{A} \), \( C_{rc} \) and \( C_{rs} \) is about one meter/meter. The sensitivity of position to the angular parameters is on the order of \( 10^8 \) meters/semicircle, and to the angular rate parameters is on the order of \( 10^{12} \) meters/semicircle/second. Because of this extreme sensitivity to angular perturbations, the value of \( \pi \) used in the curve fit is given here. \( \pi \) is a mathematical constant, the ratio of a circle's circumference to its diameter. Here \( \pi \) is taken as \( \pi = 3.1415926535898 \).

20.3.3.3 Coordinate Systems.

20.3.4.3.3.1 ECEF Coordinate Systems. The equations given in Table 20-IV provide the SV's antenna phase center position in the WGS 84 ECEF coordinate system defined as follows:
Origin* = Earth's center of mass
Z-Axis** = The direction of the IERS (International Earth Rotation and Reference Systems Service) Reference Pole (IRP)
X-Axis = Intersection of the IERS Reference Meridian (IRM) and the plane passing through the origin and normal to the Z-axis
Y-Axis = Completes a right-handed, Earth-Centered, Earth-Fixed orthogonal coordinate system

* Geometric center of the WGS 84 Ellipsoid
** Rotational axis of the WGS 84 Ellipsoid

20.3.3.4.3.3.2 Earth-Centered, Inertial (ECI) Coordinate System. In an ECI coordinate system, GPS signals propagate in straight lines at the constant speed $c^*$ (reference paragraph 20.3.4.3). A stable ECI coordinate system of convenience may be defined as being coincident with the ECEF coordinate system at a given time $t_0$. The $x$, $y$, $z$ coordinates in the ECEF coordinate system at some other time $t$ can be transformed to the $x'$, $y'$, $z'$ coordinates in the selected ECI coordinate system of convenience by the simple** rotation:

$$
x' = x \cos(\theta) - y \sin(\theta)
$$
$$
y' = x \sin(\theta) + y \cos(\theta)
$$
$$
z' = z
$$

where

$$\theta = \dot{\Omega}_e (t - t_0)$$

* The propagation speed $c$ is constant only in a vacuum. The gravitational potential also has a small effect on the propagation speed, but may be neglected by most users.

** Neglecting effects due to polar motion, nutation, and precession which may be neglected by most users for small values of $(t - t_0)$.

20.3.3.4.3.4 Geometric Range The user shall account for the geometric range ($D$) from satellite to receiver in an ECI coordinate system. $D$ may be expressed as,

$$D = | \vec{r}(t_0) - \vec{R}(t_f) |$$

where
t_T and t_R are the GPS system times of transmission and reception, respectively, and where,

\[ \vec{R}(t_T) = \text{position vector of the GPS satellite in the selected ECI coordinate system at time } t_T, \]

\[ \vec{r}(t_R) = \text{position vector of the receiver in the selected ECI coordinate system at time } t_R. \]

20.3.3.4.4 NMCT Validity Time. Users desiring to take advantage of the NMCT data provided in page 13 of subframe 4 shall first examine the AODO term currently provided in subframe 2 of the NAV data from the transmitting SV. If the AODO term is 27900 seconds (i.e., binary 11111), then the NMCT currently available from the transmitting SV is invalid and shall not be used. If the AODO term is less than 27900 seconds, then the user shall compute the validity time for that NMCT (t_nmc) using the ephemeris t_oe parameter and the AODO term from the current subframe 2 as follows:

OFFSET = t_oe [modulo 7200]
if OFFSET = 0, then t_nmc = t_oe - AODO
if OFFSET > 0, then t_nmc = t_oe - OFFSET + 7200 - AODO

Note that the foregoing computation of t_nmc must account for any beginning or end of week crossovers; for example,

if \( t^* - t_{nmc} > 302,400 \) then \( t_{nmc} = t_{nmc} + 604,800 \)
if \( t^* - t_{nmc} < -302,400 \) then \( t_{nmc} = t_{nmc} - 604,800 \)

\* t is GPS system time at time of transmission.

Users are advised that different SVs will transmit NMCTs with different t_nmc and that the best performance will generally be obtained by applying data from the NMCT with the latest (largest) t_nmc. As a result, users should compute and examine the t_nmc values for all visible and available SVs in order to find and use the NMCT with the latest t_nmc. If the same latest (largest) t_nmc is provided by two or more visible and available SVs, then the NMCT from any SV with the latest t_nmc may be selected and used; however, the estimated range deviation (ERD) value provided by the selected NMCT for the other SVs with the same t_nmc shall be set to zero if those SVs are used in the positioning solution. It should be noted that the intended positioning solution accuracy improvement will not be obtained if the data from two different NMCTs are applied simultaneously or if the data from a given NMCT is applied to just a subset of the SVs used in the positioning solution (i.e., mixed mode operation results in potentially degraded solution accuracy).
It should be noted that the NMCT information shall be supported by the Block IIR SV only when operating in the IIA like mode of operation including the Autonav Test mode.

20.3.3.5 **Subframes 4 and 5.** Both subframe 4 and 5 are subcommutated 25 times each; the 25 versions of these subframes are referred to as pages 1 through 25 of each subframe. With the possible exception of "reserved for system use" pages and explicit repeats, each page contains different specific data in words three through ten. As shown in Figure 20-1, the pages of subframe 4 utilize seven different formats, while those of subframe 5 use two. The content of words three through ten of each page is described below, followed by algorithms and material pertinent to the use of the data.

20.3.3.5.1 **Contents of Subframes 4 and 5.** Words three through ten of each page contain six parity bits as their LSBs; in addition, two non-information bearing bits are provided as bits 23 and 24 of word ten in each page for parity computation purposes. The data contained in the remaining bits of words three through ten of the various pages in subframes 4 and 5 are described in the following subparagraphs.

A brief summary of the various data contained in each page of subframes 4 and 5 is as follows:

<table>
<thead>
<tr>
<th>Subframe</th>

</tr>
</tbody>
</table>

20.3.3.5.1.1 **Data ID and SV ID.** The two MSBs of word three in each page shall contain data ID. Data ID number two (denoted by binary code 01) denotes the NAV data structure of D(t) which is described in this Appendix. Future data IDs will be defined as necessary.

As shown in Table 20-V, the data ID is utilized to provide one of two indications: (a) for those pages which are assigned to contain the almanac data of one specific SV, the data ID defines the data structure utilized by that SV.
whose almanac data are contained in that page; and (b) for all other pages, the data ID denotes the data structure of the transmitting SV.

The SV ID is given by bits three through eight of word three in each page as shown in Table 20-V. Specific IDs are reserved for each page of subframes 4 and 5. The SV IDs are utilized in two different ways: (a) for those pages which contain the almanac data of a given SV, the SV ID is the same number that is assigned to the PRN code phase of that SV (reference Table 3-I), and (b) for all other pages the SV ID assigned in accordance with Table 20-V serves as the "page ID". IDs 1 through 32 are assigned to those pages which contain the almanac data of specific SVs (pages 1-24 of subframe 5 and pages 2-5 and 7-10 of subframe 4). The "0" ID (binary all zeros) is assigned to indicate a dummy SV, while IDs 51 through 63 are utilized for pages containing other than almanac data of a specific SV. The remaining IDs (33 through 50) are unassigned.

Pages which carry the same SV ID (e.g., in subframe 4, pages 1, 6, 11, 16 and 21 carry an ID of 57, while pages 12 and 24 are designated by an ID of 62) may not be considered to contain identical data. The data in the pages with the same SV ID can be different.

* Use "0" to indicate "dummy" SV. When using "0" to indicate dummy SV, use the data ID of the transmitting SV.

**Note 1:** Data ID of that SV whose SV ID appears in that page.
**Note 2:** Data ID of transmitting SV.
**Note 3:** SV ID may vary (except for IIR/IIR-M/IIF SVs).
20.3.3.5.1.2 Almanac Data. Pages 1 through 24 of subframe 5, as well as pages 2 through 5 and 7 through 10 of subframe 4 contain the almanac data and a SV health word for up to 32 SVs (the health word is discussed in paragraph 20.3.3.5.1.3). The almanac data are a reduced-precision subset of the clock and ephemeris parameters. The data occupy all bits of words three through ten of each page except the eight MSBs of word three (data ID and SV ID), bits 17 through 24 of word five (SV health), and the 50 bits devoted to parity. The number of bits, the scale factor (LSB), the range, and the units of the almanac parameters are given in Table 20-VI. The algorithms and other material related to the use of the almanac data are given in paragraph 20.3.3.5.2.

The almanac message for any dummy SVs shall contain alternating ones and zeros with valid parity.

Users are cautioned against attempting to track a dummy SV since the results are unpredictable.

The almanac parameters shall be updated by the CS at least once every 6 days while the CS is able to upload the SVs. If the CS is unable to upload the SVs, the accuracy of the almanac parameters transmitted by the SVs will degrade over time.

For Block II and IIA SVs, three sets of almanac shall be used to span at least 60 days. The first and second sets will be transmitted for up to six days each; the third set is intended to be transmitted for the remainder of the 60 days minimum, but the actual duration of transmission will depend on the individual SV’s capability to retain data in memory. All three sets are based on six-day curve fits that correspond to the first six days of the transmission interval.

For Block IIR/IIR-M, IIF, and GPS III SVs, five sets of almanac shall be used to span at least 60 days. The first, second, and third sets will be transmitted for up to six days each; the fourth and fifth sets will be transmitted for up to 32 days; the fifth set is intended to be transmitted for the remainder of the 60 days minimum, but the actual duration of transmission will depend on the individual SV’s capability to retain data in memory.

The first, second, and third sets are based on six day curve fits. The fourth and fifth sets are based on 32 day curve fits.

* Parameters so indicated shall be two's complement with the sign bit (+ or -) occupying the MSB;

** See Figure 20-1 for complete bit allocation in subframe;

*** Unless otherwise indicated in this column, effective range is the maximum range attainable with indicated bit allocation and scale factor;

**** Relative to $i_0 = 0.30$ semi-circles.

20.3.3.5.1.3 **SV Health.** Subframes 4 and 5 contain two types of SV health data: (a) each of the 32 pages which contain the clock/ephemeris related almanac data provide an eight-bit SV health status word regarding the SV whose almanac data they carry, and (b) the 25th page of subframe 4 and of subframe 5 jointly contain six-bit health status data for up to 32 SVs.

The three MSBs of the eight-bit health words indicate health of the NAV data in accordance with the code given in Table 20-VII. The six-bit words provide a one-bit summary of the NAV data's health status in the MSB position in accordance with paragraph 20.3.3.3.1.4. The five LSBs of both the eight-bit and the six-bit words provide the health status of the SV’s signal components in accordance with the code given in Table 20-VIII. A special meaning is assigned, however, to the "6 ones" combination of the six-bit health words in the 25th page of subframes 4 and 5: it
indicates that "the SV which has that ID is not available and there may be no data regarding that SV in that page of subframes 4 and 5 that is assigned to normally contain the almanac data of that SV" (NOTE: this special meaning applies to the 25th page of subframes 4 and 5 only). The health indication shall be given relative to the "as designed" capabilities of each SV (as designated by the configuration code -- see paragraph 20.3.3.5.1.4). Accordingly, any SV which does not have a certain capability will be indicated as "healthy" if the lack of this capability is inherent in its design or it has been configured into a mode which is normal from a user standpoint and does not require that capability.

Additional SV health data are given in subframe 1. The data given in subframes 1, 4, and 5 of the other SVs may differ from that shown in subframes 4 and/or 5 since the latter may be updated at a different time.

The eight-bit health status words shall occupy bits 17 through 24 of word five in those 32 pages which contain almanac data for individual SVs. The six-bit health status words shall occupy the 24 MSBs of words four through nine in page 25 of subframe 5 plus bits 19 through 24 of word 8, the 24 MSBs of word 9, and the 18 MSBs of word 10 in page 25 of subframe 4.

The predicted health data will be updated at the time of upload when a new almanac has been built by the CS. The transmitted health data may not correspond to the actual health of the transmitting SV or other SVs in the constellation.

* 3 to 6 dB below specified power level due to reduced power output, excess phase noise, SV attitude, etc.

** See definition above for Health Code 11111.

*** Note: Deformed means one or more signals do not meet the requirements in Section 3.
20.3.5.1.4 **Anti-Spoof (A-S) Flags and SV Configurations.** Page 25 of subframe 4 shall contain a four-bit-long term for each of up to 32 SVs to indicate the A-S status and the configuration code of each SV. The MSB of each four-bit term shall be the A-S flag with a "1" indicating that A-S is ON. The three LSBs shall indicate the configuration of each SV using the following code:

<table>
<thead>
<tr>
<th>Code</th>

</tr>
</tbody>
</table>

Additional codes will be assigned in the future, should the need arise.

These four-bit terms shall occupy bits 9 through 24 of word three, the 24 MSBs of words four through seven, and the 16 MSBs of word eight, all in page 25 of subframe 4.

Since the anti-spoof information is updated by the CS at the time of upload, the anti-spoof data may not correspond to the actual anti-spoof status of the transmitting SV or other SVs in the constellation.
20.3.3.5.1.5 **Almanac Reference Week.** Bits 17 through 24 of word three in page 25 of subframe 5 shall indicate the number of the week (WNₐ) to which the almanac reference time (tₒa) is referenced (see paragraphs 20.3.3.5.1.2 and 20.3.3.5.2.2). The WNₐ term consists of eight bits which shall be a modulo 256 binary representation of the GPS week number (see paragraph 6.2.4) to which the tₒa is referenced. Bits 9 through 16 of word three in page 25 of subframe 5 shall contain the value of tₒa which is referenced to this WNₐ.

20.3.3.5.1.6 **Coordinated Universal Time (UTC) Parameters.** The 24 MSBs of words six through nine plus the eight MSBs of word ten in page 18 of subframe 4 shall contain the parameters related to correlating UTC time with GPS time. The bit length, scale factors, ranges, and units of these parameters are given in Table 20-IX. The related algorithms are described in paragraph 20.3.3.5.2.4.

The UTC parameters shall be updated by the CS at least once every six days while the CS is able to upload the SVs. If the CS is unable to upload the SVs, the accuracy of the UTC parameters transmitted by the SVs will degrade over time.

20.3.3.5.1.7 **Ionospheric Data.** The ionospheric parameters which allow the "L1 only" or "L2 only" user to utilize the ionospheric model (reference paragraph 20.3.3.5.2.5) for computation of the ionospheric delay are contained in page 18 of subframe 4. They occupy bits 9 through 24 of word three plus the 24 MSBs of words four and five. The bit lengths, scale factors, ranges, and units of these parameters are given in Table 20-X.

The ionospheric data shall be updated by the CS at least once every six days while the CS is able to upload the SVs. If the CS is unable to upload the SVs, the ionospheric data transmitted by the SVs may not be accurate.

20.3.3.5.1.8 **Special Messages.** Page 17 of subframe 4 shall be reserved for special messages with the specific contents at the discretion of the Operating Command. It shall accommodate the transmission of 22 eight-bit ASCII characters. The requisite 176 bits shall occupy bits 9 through 24 of word three, the 24 MSBs of words four through nine, plus the 16 MSBs of word ten. The eight MSBs of word three shall contain the data ID and SV ID, while bits 17 through 22 of word ten shall be reserved for system use. The remaining 50 bits of words three through ten are used for parity (six bits/word) and parity computation (two bits in word ten). The eight-bit ASCII characters shall be limited to the following set:
<table>
<thead>
<tr>
<th>Alphanumeric Character</th>
<th>ASCII Character</th>

20.3.3.5.1.9 NMCT. Page 13 of subframe 4 shall contain the NMCT data appropriate to the transmitting SV. Each NMCT contains a two-bit availability indicator (AI) followed by 30 slots which may contain up to 30 valid six-bit ERD values. The layout of these 31 data items is as shown in Figure 20-1.

The two-bit AI in bits 9 and 10 of word three of page 13 of subframe 4 provide the user with the following information.
<table>
<thead>
<tr>
<th>AI</th>
<th>Navigation Message Correction Table Availability</th>
</tr>
</thead>
<tbody>
<tr>
<td>00</td>
<td>The correction table is unencrypted and is available to both precise positioning service users and standard positioning service users.</td>
</tr>
<tr>
<td>01</td>
<td>The correction table is encrypted and is available only to authorized users (normal mode).</td>
</tr>
<tr>
<td>10</td>
<td>No correction table available for either precise positioning service users or standard positioning service users.</td>
</tr>
<tr>
<td>11</td>
<td>Reserved</td>
</tr>
</tbody>
</table>

Each one of the 30 six-bit ERD slots in bits 11 through 24 of word three, bits 1 through 24 of words four through nine, and bits 1 through 22 of word ten of page 13 of subframe 4 will correspond to an ERD value for a particular SV ID. There are 31 possible SV IDs that these ERD slots may correspond to, ranging from SV ID 1 to SV ID 31. SV ID 32 is not a valid SV ID for any of the slots in an NMCT. The correspondence between the 30 ERD slots and the 31 possible SV IDs depends on the SV ID of the particular transmitting SV in accordance with the following two rules: 1) the CS shall ensure via upload that no SV shall transmit an NMCT containing an ERD value which applies to its own SV ID, and 2) the CS shall ensure via upload that all ERD values shall be transmitted in ascending numerical slot order of the corresponding SV ID. To illustrate: the SV operating as SV ID 1 will transmit (in order) ERD values which correspond to SV ID 2 through SV ID 31 in ERD slots 1 through 30 respectively, while the SV operating as SV ID 31 will transmit ERD values which correspond to SV ID 1 through SV ID 30 in ERD slots 1 through 30 respectively.

Each ERD value contained in an NMCT ERD slot shall be represented as a six-bit two’s complement field with the sign bit occupying the MSB and an LSB of 0.3 meters for an effective range of ±9.3 m. A binary value of “100000” shall indicate that no valid ERD for the corresponding SV ID is present in that slot.

20.3.3.5.2 Algorithms Related to Subframe 4 and 5 Data. The following algorithms shall apply when interpreting Almanac, Coordinated Universal Time, Ionospheric Model, and NMCT data in the NAV message.

20.3.3.5.2.1 Almanac. The almanac is a subset of the clock and ephemeris data, with reduced precision. The user algorithm is essentially the same as the user algorithm used for computing the precise ephemeris from the one subframe 1, 2, and 3 parameters (see Table 20-IV). The almanac content for one SV is given in Table 20-VI. A close inspection of Table 20-VI will reveal that a nominal inclination angle of 0.30 semicircles is implicit and that the parameter $\delta_i$ (correction to inclination) is transmitted, as opposed to the value computed by the user. All other parameters appearing in the equations of Tables 20-IV, but not included in the content of the almanac, are set to zero for SV position determination. In these respects, the application of the Table 20-IV equations differs between the almanac and the ephemeris computations.

The user is cautioned that the sensitivity to small perturbations in the parameters is even greater for the almanac than for the ephemeris, with the sensitivity of the angular rate terms over the interval of applicability on the order of $10^{14}$.
meters/(semicircle/second). An indication of the URE provided by a given almanac during each of the operational intervals is as follows:

<table>
<thead>
<tr>
<th>Operational Interval</th>
<th>Almanac Ephemeris URE (estimated by analysis) 1 sigma (meters)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Normal</td>
<td>900* †</td>
</tr>
<tr>
<td>Short-term Extended</td>
<td>900 - 3,600*</td>
</tr>
<tr>
<td>Long-term Extended</td>
<td>3600 - 300,000*</td>
</tr>
</tbody>
</table>

* URE values generally tend to degrade quadratically over time. Larger errors may be encountered during eclipse seasons and whenever a propulsive event has occurred.

† After the CS is unable to upload the SVs, URE values for the SVs operating in the Autonav mode

20.3.3.5.2.2 **Almanac Reference Time.** Within each upload, the CS shall ensure that all $t_{oa}$ values in subframes 4 and 5 shall be the same for a given almanac data set and shall differ for successive data sets which contain changes in almanac parameters or SV health. In addition, the Block IIR/IIR-M SVs will also ensure that, based on a valid CS upload, all $t_{oa}$ values in subframes 4 and 5 will be the same for a given almanac data set and will differ for successive data sets which contain changes in almanac parameters.

Note that cutover to a new upload may continue to indicate the same $t_{oa}$ values in subframes 4 and 5 as prior to the cutover but the new almanac data set may contain changes in almanac parameters or SV health. Note also that cutover to a new upload may occur between the almanac pages of interest and page 25 of subframe 5 (reference paragraph 20.3.4.1), and thus there may be a temporary inconsistency between $t_{oa}$ in the almanac page of interest, and in word 3 of page 25 of subframe 5. The $t_{oa}$ mismatch signifies that this WN$_a$ may not apply to the almanac of interest and that the user must not apply almanac data until the pages with identical values of $t_{oa}$ are obtained.

Normal and Short-term Extended Operations. The almanac reference time, $t_{oa}$, is some multiple of $2^{12}$ seconds occurring approximately 70 hours after the first valid transmission time for this almanac data set (reference 20.3.4.5). The almanac is updated often enough to ensure that GPS time, $t$, shall differ from $t_{oa}$ by less than 3.5 days during the transmission period. The time from epoch $t_e$ shall be computed as described in Table 20-IV, except that $t_{oa}$ shall be replaced with $t_{oa}$.

Long-term Extended Operations. During long-term extended operations or if the user wishes to extend the use time of the almanac beyond the time span that it is being transmitted, one must account for crossovers into time spans where these computations of $t_k$ are not valid. This may be accomplished without time ambiguity by recognizing that the almanac reference time ($t_{oa}$) is referenced to the almanac reference week (WN$_a$), both of which are given in word three of page 25 of subframe 5 (see paragraph 20.3.3.5.1.5).
20.3.3.5.2.3 **Almanac Time Parameters.** The almanac time parameters shall consist of an 11-bit constant term \( a_{f0} \) and an 11-bit first order term \( a_{f1} \). The applicable first order polynomial, which shall provide time to within 2 microseconds of GPS time \( t \) during the interval of applicability, is given by

\[
t = t_{sv} - \Delta t_{sv}
\]

where

- \( t \) = GPS system time (seconds),
- \( t_{sv} \) = effective SV PRN code phase time at message transmission time (seconds),
- \( \Delta t_{sv} \) = SV PRN code phase time offset (seconds).

The SV PRN code phase offset is given by

\[
\Delta t_{sv} = a_{f0} + a_{f1} t_k
\]

where the computation of \( t_k \) is described in paragraph 20.3.3.5.2.2, and the polynomial coefficients \( a_{f0} \) and \( a_{f1} \) are given in the almanac. Since the periodic relativistic effect is less than 25 meters, it need not be included in the time scale used for almanac evaluation. Over the span of applicability, it is expected that the almanac time parameters will provide a statistical URE component of less than 135 meters, one sigma. This is partially due to the fact that the error caused by the truncation of \( a_{f0} \) and \( a_{f1} \) may be as large as 150 meters plus 50 meters/day relative to the \( t_{oa} \) reference time.

During extended operations (short-term and long-term) the almanac time parameter may not provide the specified time accuracy or URE component. Additionally, occasional CS actions to manage clock offsets may also inhibit the ability to provide specified almanac time parameter accuracies.
20.3.3.5.2.4 Coordinated Universal Time (UTC). Page 18 of subframe 4 includes: (1) the parameters needed to relate GPS time to UTC, and (2) notice to the user regarding the scheduled future or recent past (relative to NAV message upload) value of the delta time due to leap seconds (\(\Delta t_{\text{LSF}}\)), together with the week number (WN_{LSF}) and the day number (DN) at the end of which the leap second becomes effective. "Day one" is the first day relative to the end/start of week and the WN_{LSF} value consists of eight bits which shall be a modulo 256 binary representation of the GPS week number (see paragraph 6.2.4) to which the DN is referenced. The user must account for the truncated nature of this parameter as well as truncation of WN, WN_t, and WN_{LSF} due to rollover of full week number (see paragraph 3.3.4(b)). The CS shall manage these parameters such that, when \(\Delta t_L\) and \(\Delta t_{LSF}\) differ, the absolute value of the difference between the untruncated WN and WN_{LSF} values shall not exceed 127.

Depending upon the relationship of the effectivity date to the user's current GPS time, the following three different UTC/GPS-time relationships exist:

a. Whenever the effectivity time indicated by the WN_{LSF} and the DN values is not in the past (relative to the user's present time), and the user's present time does not fall in the time span which starts at six hours prior to the effectivity time and ends at six hours after the effectivity time, the UTC/GPS-time relationship is given by

\[
t_{\text{UTC}} = (t_E - \Delta t_{\text{UTC}}) \mod 86400 \text{ seconds}
\]

where \(t_{\text{UTC}}\) is in seconds and

\[
\Delta t_{\text{UTC}} = \Delta t_L + A_0 + A_1 (t_E - t_{\text{ot}} + 604800 (WN - WN_t)), \text{ seconds;}
\]

\[
t_E = \text{GPS time as estimated by the user after correcting t}_{\text{SV}} \text{ for factors described in paragraph 20.3.3.3.3 as well as for selective availability (SA) (dither) effects;}
\]

\[
\Delta t_L = \text{delta time due to leap seconds;}
\]

\(A_0\) and \(A_1\) = constant and first order terms of polynomial;

The estimated GPS time \(t_E\) shall be in seconds relative to end/start of week. During the normal and short-term extended operations, the reference time for UTC data, \(t_{\text{ot}}\), is some multiple of \(2^{12}\) seconds occurring approximately 70 hours after the first valid transmission time for this UTC data set (reference 20.3.4.5). The reference time for UTC data \(t_{\text{ot}}\) shall be referenced to the start of that week whose number \(WN_t\) is given in word eight of page 18 in subframe 4. The WN_t value consists of eight bits which shall be a modulo 256 binary representation of the GPS week number (see paragraph 6.2.4) to which the \(t_{\text{ot}}\) is referenced. The user must account for the truncated nature of this parameter as well as truncation of WN, WN_t, and WN_{LSF} due to rollover of full week number (see paragraph
3.3.4(b)). The CS shall manage these parameters such that the absolute value of the difference between the untruncated WN and WN values shall not exceed 127.

b. Whenever the user’s current time falls within the time span of six hours prior to the effectivity time to six hours after the effectivity time, proper accommodation of the leap second event with a possible week number transition is provided by the following expression for UTC:

\[ t_{\text{UTC}} = W \mod (86400 + \Delta t_{\text{LSF}} - \Delta t_{\text{LS}}), \text{seconds}; \]

where

\[ W = (t_E - \Delta t_{\text{UTC}} - 43200) \mod 86400 + 43200, \text{seconds}; \]

and the definition of \( \Delta t_{\text{UTC}} \) (as given in 20.3.3.5.2.4a above) applies throughout the transition period. Note that when a leap second is added, unconventional time values of the form 23:59:60.xxx are encountered. Some user equipment may be designed to approximate UTC by decrementing the running count of time within several seconds after the event, thereby promptly returning to a proper time indication. Whenever a leap second event is encountered,

c. Whenever the effectivity time of the leap second event, as indicated by the WN_{LSF} and DN values, is in the "past" (relative to the user’s current time), and the user’s current time does not fall in the time span as given above in 20.3.3.5.2.4b, the relationship previously given for \( t_{\text{UTC}} \) in 20.3.3.5.2.4a above is valid except that the value of \( \Delta t_{\text{LSF}} \) is substituted for \( \Delta t_{\text{LS}} \). The CS will coordinate the update of UTC parameters at a future upload so as to maintain a proper continuity of the \( t_{\text{UTC}} \) time scale.
20.3.5.2.5 Ionospheric Model. The "two frequency" (L1 and L2) user shall correct the time received from the SV for ionospheric effect by utilizing the time delay differential between L1 and L2 (reference paragraph 20.3.3.3.3.3). The "one frequency" user, however, may use the model given in Figure 20-4 to make this correction. It is estimated that the use of this model will provide at least a 50 percent reduction in the single-frequency user's RMS error due to ionospheric propagation effects. During extended operations, or for the SVs in the Autonav mode if the CS is unable to upload the SVs, the use of this model will yield unpredictable results.

20.3.5.2.6 NMCT Data. For each SV, the ERD value in the NMCT is an estimated pseudorange error. Each ERD value is computed by the CS and represents the radial component of the satellite ephemeris error minus the speed of light times the satellite clock error. The satellite ephemeris and clock errors are computed by subtracting the broadcast from current estimates. Therefore, the ERD value may be used as follows to correct the user's measured pseudorange:

\[
PR_c = PR - ERD
\]

where,

\[
PR_c = \text{pseudorange corrected with the ERD value from the NMCT}
\]
\[
PR = \text{measured pseudorange.}
\]

Note that as described above, the ERD values are actually error estimates rather than differential corrections and so are subtracted rather than added in the above equation.
The ionospheric correction model is given by

\[
T_{\text{iono}} = \begin{cases} 
F \cdot 5.0 \times 10^{-9} & \text{AMP} \geq 0, |x| < 1.57 \\
F \cdot 5.0 \times 10^{-9} & \text{AMP} < 0, |x| \geq 1.57 
\end{cases} \quad \text{(sec)}
\]

where

\[T_{\text{iono}}\] is referred to the L1 frequency; if the user is operating on the L2 frequency, the correction term must be multiplied by \( \gamma \) (reference paragraph 20.3.3.3.3.2),

\[\text{AMP} = \left\{ \sum_{n=0}^{3} \alpha_n \phi_m^n, \text{AMP} \geq 0 \right\} \quad \text{(sec)}
\]

if AMP < 0, AMP = 0

\[x = \frac{2\pi (t - 50400)}{\text{PER}} \quad \text{(radians)}\]

\[\text{PER} = \left\{ \sum_{n=0}^{3} \beta_n \phi_m^n, \text{PER} \geq 72,000 \right\} \quad \text{(sec)}
\]

if PER < 72,000, PER = 72,000

\[F = 1.0 + 16.0 \times [0.53 - E]^3\]

and \( \alpha_n \) and \( \beta_n \) are the satellite transmitted data words with \( n = 0, 1, 2, \) and 3.

Figure 20-4. Ionospheric Model (Sheet 1 of 3)
Other equations that must be solved are

\[ \phi_m = \phi_i + 0.064 \cos(\lambda_i - 1.617) \]  

(semi-circles)

\[ \lambda_i = \lambda_u + \frac{\psi \sin A}{\cos \phi_i} \]  

(semi-circles)

\[ \phi_i = \begin{cases} 
\phi_u + \psi \cos A, & |\phi_i| \leq 0.416 \\
\quad \quad \text{if } \phi_i > +0.416, \text{ then } \phi_i = +0.416, \\
\quad \quad \text{if } \phi_i < -0.416, \text{ then } \phi_i = -0.416 
\end{cases} \]  

(semi-circles)

\[ \psi = \frac{0.0137}{E + 0.11} - 0.022 \]  

(semi-circles)

\[ t = 4.32 \times 10^4 \lambda_i + \text{GPS time} \]  

(sec)

where

0 \leq t < 86400: therefore, if t \geq 86400 seconds, subtract 86400 seconds;

if t < 0 seconds, add 86400 seconds.

Figure 20-4. Ionospheric Model (Sheet 2 of 3)
The terms used in computation of ionospheric delay are as follows:

**Satellite Transmitted Terms**

- \( \alpha_n \) - the coefficients of a cubic equation representing the amplitude of the vertical delay (4 coefficients - 8 bits each)
- \( \beta_n \) - the coefficients of a cubic equation representing the period of the model (4 coefficients - 8 bits each)

**Receiver Generated Terms**

- \( E \) - elevation angle between the user and satellite (semi-circles)
- \( A \) - azimuth angle between the user and satellite, measured clockwise positive from the true North (semi-circles)
- \( \phi_u \) - user geodetic latitude (semi-circles) WGS 84
- \( \lambda_u \) - user geodetic longitude (semi-circles) WGS 84
- GPS time - receiver computed system time

**Computed Terms**

- \( X \) - phase (radians)
- \( F \) - obliquity factor (dimensionless)
- \( t \) - local time (sec)
- \( \phi_m \) - geomagnetic latitude of the earth projection of the ionospheric intersection point (mean ionospheric height assumed 350 km) (semi-circles)
- \( \lambda_i \) - geodetic longitude of the earth projection of the ionospheric intersection point (semi-circles)
- \( \phi_i \) - geodetic latitude of the earth projection of the ionospheric intersection point (semi-circles)
- \( \psi \) - earth's central angle between the user position and the earth projection of ionospheric intersection point (semi-circles)

Figure 20-4. Ionospheric Model (Sheet 3 of 3)
20.3.4 **Timing Relationships.** The following conventions shall apply.

**20.3.4.1 Paging and Cutovers.** At end/start of week (a) the cyclic paging of subframes 1 through 5 shall restart with subframe 1 regardless of which subframe was last transmitted prior to end/start of week, and (b) the cycling of the 25 pages of subframes 4 and 5 shall restart with page 1 of each of the subframes, regardless of which page was the last to be transmitted prior to the end/start of week. Cutovers to newly updated data for subframes 1, 2, and 3 occur on frame boundaries (i.e., modulo 30 seconds relative to end/start of week). Newly updated data for subframes 4 and 5 may start to be transmitted with any of the 25 pages of these subframes.

**20.3.4.2 SV Time vs. GPS Time.** In controlling the SVs and uploading of data, the CS shall allow for the following timing relationships:

- a. Each SV operates on its own SV time;
- b. All time-related data in the TLM word and the HOW shall be in SV-time;
- c. All other data in the NAV message shall be relative to GPS time;
- d. The acts of transmitting the NAV message shall be executed by the SV on SV time.

**20.3.4.3 Speed of Light.** The speed of light used by the CS for generating the data described in the above paragraphs is

\[ c = 2.99792458 \times 10^8 \text{ meters per second} \]

which is the official WGS 84 speed of light. The user shall use the same value for the speed of light in all computations.

**20.3.4.4 Data Sets.** The IODE is an 8 bit number equal to the 8 LSBs of the 10 bit IODC of the same data set. The following rules govern the transmission of IODC and IODE values in different data sets: (1) The transmitted IODC will be different from any value transmitted by the SV during the preceding seven days; (2) The transmitted IODE will be different from any value transmitted by the SV during the preceding six hours. The range of IODC will be as given in Table 20-XI for Block II/IIA SVs and Table 20-XII for Block IIR/IIR-M/IIF and GPS III SVs.

Cutovers to new data sets will occur only on hour boundaries except for the first data set of a new upload. The first data set may be cut-in (reference paragraph 20.3.4.1) at any time during the hour and therefore may be transmitted by the SV for less than one hour. During short-term operations, cutover to 4-hour sets and subsequent cutovers to succeeding 4-hour data sets will always occur modulo 4 hours relative to end/start of week. Cutover from 4-hour data sets to 6-hour data sets shall occur modulo 12 hours relative to end/start of week. Cutover from 12-hour data sets to 24-hour data sets shall occur modulo 24 hours relative to end/start of week. Cutover from a data set transmitted 24 hours or more occurs on a modulo 24-hour boundary relative to end/start of week.
The start of the transmission interval for each data set corresponds to the beginning of the curve fit interval for the data set. Each data set nominally remains valid for the duration of its curve fit interval. A data set may be rendered invalid before the end of its curve fit interval when it is superseded by the SV cutting over to new data.

**Normal Operations.** The subframe 1, 2, and 3 data sets are transmitted by the SV for periods of two hours. The corresponding curve fit interval is four hours. SVs operating in the Autonav mode will deviate. They will transmit subframe 1, 2, and 3 data sets for periods of one hour. The corresponding curve-fit interval will be four hours.

**Short-term and Long-term Extended Operations.** The transmission intervals and curve fit intervals with the applicable IODC ranges are given in Tables 20-XI and 20-XII.

</tbody>
</table>

Note 1: For transmission intervals of 6 and 12 hours, the IODC values shown will be transmitted in increasing order.

Note 2: IODC values for blocks with 1-, 2- or 4-hour transmission intervals (at least the first 14 days after upload) shall be any numbers in the range 0 to 1023 excluding those values of IODC that correspond to IODE values in the range 240-255, subject to the constraints on re-transmission given in paragraph 20.3.4.4. The CS can define the GPS III SV time of transition from the 4 hour curve fits into extended navigation (beyond 4 hour curve fits). Following the transition time, the SV will follow the timeframes defined in the table, including appropriately setting IODC values.

Note 3: The ninth 12-hour data set may not be transmitted.

Note 4: SVs operating in the Autonav mode will have transmission intervals of 1 hour per paragraph 20.3.4.4.

Note 5: The first data set of a new upload may be cut-in at any time and therefore the transmission interval may be less than the specified value.

20.3.4.5 Reference Times. Many of the parameters which describe the SV state vary with true time, and must therefore be expressed as time functions with coefficients provided by the Navigation Message to be evaluated by the user equipment. These include the following parameters as functions of GPS time:

a. SV time,
b. Mean anomaly,
c. Longitude of ascending node,
d. UTC,
e. Inclination.
Each of these parameters is formulated as a polynomial in time. The specific time scale of expansion can be arbitrary. Due to the short data field lengths available in the Navigation Message format, the nominal epoch of the polynomial is chosen near the midpoint of the expansion range so that quantization error is small. This results in time epoch values which can be different for each data set. Time epochs contained in the Navigation Message and the different algorithms which utilize them are related as follows:

<table>
<thead>
<tr>
<th>Epoch</th>
<th>Application Algorithm Reference</th>
</tr>
</thead>
<tbody>
<tr>
<td>$t_{oc}$</td>
<td>20.3.3.3.3.1</td>
</tr>
<tr>
<td>$t_{oe}$</td>
<td>20.3.3.4.3</td>
</tr>
<tr>
<td>$t_{oa}$</td>
<td>20.3.3.5.2.2 and 20.3.3.5.2.3</td>
</tr>
<tr>
<td>$t_{ot}$</td>
<td>20.3.3.5.2.4</td>
</tr>
</tbody>
</table>

Table 20-XIII describes the nominal selection which will be expressed modulo 604,800 seconds in the Navigation Message.

The coefficients of expansion are obviously dependent upon choice of epoch, and thus the epoch time and expansion coefficients must be treated as an inseparable parameter set. Note that a user applying current navigation data will normally be working with negative values of $(t-t_{oc})$ and $(t-t_{oe})$ in evaluating the expansions.

The CS (Block II/IIA/IIR/IIR-M/IIF) and SS (GPS III) shall assure that the $t_{oe}$ value, for at least the first data set transmitted by an SV after a new upload, is different from that transmitted prior to the cutover (see paragraph 20.3.4.4). As such, when a new upload is cutover for transmission, the CS (Block IIA/IIR/IIR-M/IIF) and SS (GPS III) shall introduce a small deviation in the $t_{oe}$ resulting in the $t_{oe}$ value that is offset from the hour boundaries (see Table 20-XIII). This offset $t_{oe}$ will be transmitted by an SV in the first data set after a new upload cutover and the second data set, following the first data set, may also continue to reflect the same offset in the $t_{oe}$.

When the $t_{oe}$, immediately prior to a new upload cutover, already reflects a small deviation (i.e. a new upload cutover has occurred in the recent past), then the CS (Block II/IIA/IIR/IIR-M/IIF) and SS (GPS III) shall introduce an additional deviation to the $t_{oe}$ when a new upload is cutover for transmission.

A change from the broadcast reference time immediately prior to cutover is used to indicate a change of values in the data set. The user may use the following example algorithm to detect the occurrence of a new upload cutover:

$$DEV = t_{oe} \mod 3600$$

If $DEV \neq 0$, then a new upload cutover has occurred within past 4 hours.

* Some SVs will have transmission intervals of 1 hour per paragraph 20.3.4.4.
20.3.5 **Data Frame Parity.** The data signal shall contain parity coding according to the following conventions.

20.3.5.1 **User Frame Parity.** This algorithm links 30-bit words within and across subframes of ten words using the (32,26) Hamming Code described in Table 20-XIV.

20.3.5.2 **User Parity Algorithm.** As far as the user is concerned, several options are available for performing data decoding and error detection. Figure 20-5 presents an example flow chart that defines one way of recovering data (dₙ) and checking parity. The parity bit Dₚₙ is used for recovering raw data. The parity bits D₂ₙ and D₃₀, along with the recovered raw data (dₙ) are modulo-2 added in accordance with the equations appearing in Table 20-XIV for D₂₃ . . . D₃₀, which provide parity to compare with transmitted parity D₂₅ . . . D₃₀.

<table>

</tbody>
</table>

Where

- d₁, d₂, ..., d₂₄ are the source data bits;
- the symbol * is used to identify the last 2 bits of the previous word of the subframe;
- D₂₅, D₂₆, ..., D₃₀ are the computed parity bits;
- D₁, D₂, ..., D₂₉, D₃₀ are the bits transmitted by the SV;
- ⊕ is the "modulo-2" or "exclusive-or" operation.
Figure 20-5. Example Flow Chart for User Implementation of Parity Algorithm
30. APPENDIX III. GPS NAVIGATION DATA STRUCTURE FOR CNAV DATA, $D_C(t)$

30.1 Scope. This appendix describes the specific GPS CNAV data structure denoted as $D_C(t)$.

30.2 Applicable Documents.

30.2.1 Government Documents. In addition to the documents listed in paragraph 2.1, the following documents of the issue specified contribute to the definition of the CNAV data related interfaces and form a part of this Appendix to the extent specified herein.

- Specifications
  - None
- Standards
  - None
- Other Publications
  - None

30.2.2 Non-Government Documents. In addition to the documents listed in paragraph 2.2, the following documents of the issue specified contribute to the definition of the CNAV data related interfaces and form a part of this Appendix to the extent specified herein.

- Specifications
  - None
- Other Publications
  - None

30.3 Requirements.

30.3.1 Data Characteristics. The CNAV data, $D_C(t)$, is a higher precision representation and nominally contains more accurate data than the NAV data, $D(t)$, described in Appendix II. Also, the CNAV data stream uses a different parity algorithm.

Users are advised that the CNAV data, $D_C(t)$, described in this appendix and the NAV data, $D(t)$, described in Appendix II, should not be mixed in any user algorithms or applications. Each of the two data sets should be treated as a set and used accordingly.
30.3.2 **Message Structure.** As shown in Figures 30-1 through 30-14, the CNAV message structure utilizes a basic format of twelve-second 300-bit long messages. Each message contains a Cyclic Redundancy Check (CRC) parity block consisting of 24 bits covering the entire twelve-second message (300 bits) (reference Section 30.3.5). Message type 0 (zero) is defined to be the default message. In the event of message generation failure, the SV shall replace each affected message type with the default message type. In the event that a particular message is not assigned (by the CS) a particular message type for broadcast, the SV shall generate and broadcast the default message type in that message slot.

Currently undefined and unused message types are reserved for future use.

Block IIR-M and IIF SVs have the capability of storing at least 48 hours of CNAV navigation data, with current memory margins, to provide CNAV positioning service without contact from the CS for that period. GPS III SVs have the capability of providing up to 60 days of CNAV positioning service without contact from the CS. The timeframe is defined by the CS.

30.3.3 **Message Content.** Each message starts with an 8-bit preamble - 10001011, followed by a 6-bit PRN number of the transmitting SV, a 6-bit message type ID with a range of 0 (000000) to 63 (111111), and the 17-bit message time of week (TOW) count. When the value of the message TOW count is multiplied by 6, it represents SV time in seconds at the start of the next 6-second message.

An “alert” flag, when raised (bit 38 = “1”), indicates to the user that the signal URA components may be worse than indicated in the associated message types and that he shall use at his own risk. For each default message (Message Type 0), bits 39 through 276 shall be alternating ones and zeros and the message shall contain a proper CRC parity block.

* MESSAGE TOW COUNT = 17 MSB OF ACTUAL TOW COUNT AT START OF NEXT 12-SECOND MESSAGE

EDC = Ephemeris Differential Correction
MESSAGE TOW COUNT = 17 MSB OF ACTUAL TOW COUNT AT START OF NEXT 12-SECOND MESSAGE

Figure 30-14. Message Type 15 – Text
30.3.3.1 Message Type 10 and 11 Ephemeris and Health Parameters.

30.3.3.1.1 Message Type 10 and 11 Ephemeris and Health Parameter Content. The contents of the SV health, ephemeris representation and accuracy parameters in message types 10 and 11 are defined below, followed by material pertinent to the use of the data. Message type 10 in conjunction with message type 11, provides users with the requisite data to calculate SV position. The general format of message types 10 and 11 consists of data fields for reference time tags, a set of gravitational harmonic correction terms, rates and rate corrections to quasi-Keplerian elements, and an accuracy indicator for ephemeris-related data.

The ephemeris parameters in the message type 10 and type 11 describe the orbit of the transmitting SV during the curve fit interval of three hours. The nominal transmission interval is two hours, and shall coincide with the first two hours of the curve fit interval. The predicted period of applicability for ephemeris data coincides with the entire three-hour curve fit interval. Table 30-I gives the definition of the orbital parameters using terminology typical of Keplerian orbital parameters; it is noted, however, that the transmitted parameter values are expressed such that they provide the best trajectory fit in Earth-Centered, Earth-Fixed (ECEF) coordinates for each specific fit interval. The user shall not interpret intermediate coordinate values as pertaining to any conventional coordinate system.

The \( t_{oe} \) term shall provide the user with a convenient means for detecting any change in the ephemeris representation parameters. The \( t_{oe} \) is provided in both message type 10 and 11 for the purpose of comparison with the \( t_{oc} \) term in message type 30-37. Whenever these three terms do not match, a data set cutover has occurred and new data must be collected. The timing of the \( t_{oe} \) and constraints on the \( t_{oc} \) and \( t_{oe} \) are defined in paragraph 30.3.4.4.

Any change in the message type 10 and 11 ephemeris data will be accomplished with a simultaneous change in the \( t_{oe} \) value. The CS will assure the \( t_{oe} \) value for Block IIR-M/IIF and SS will assure the \( t_{oe} \) value for Block III, for at least the first data set transmitted by an SV after an upload, is different from that transmitted prior to the cutover. See Section 30.3.4.5 for additional information regarding \( t_{oe} \).

The CNAV messages contain information that allows users to take advantage of situations when integrity is assured to the enhanced level. This is accomplished using a composite integrity assured URA value in conjunction with an integrity status flag. The composite integrity assured URA (IAURA) value is the RSS of an elevation-dependent function of the upper bound value of the URA\(_{ED} \) component and the upper bound value of the URA\(_{NED} \) component. The composite IAURA value is assured to the enhanced level only when the integrity status flag is “1”; otherwise the IAURA value is assured to the legacy level.

Bit 272 of Message Type 10 is the Integrity Status Flag (ISF). A "0" in bit position 272 indicates that the conveying signal is provided with the legacy level of integrity assurance. That is, the probability that the instantaneous URE of the conveying signal exceeds 4.42 times the current broadcast IAURA value, for more than 5.2 seconds, without an accompanying alert, is less than 1E-5 per hour. A "1" in bit-position 272 indicates that the conveying signal is provided with an enhanced level of integrity assurance. That is, the probability that the instantaneous URE of the
conveying signal exceeds 5.73 times the current broadcast IAURA value, for more than 5.2 seconds, without an accompanying alert, is less than 1E-8 per hour. The probabilities associated with the nominal and lower bound values of the current broadcast URA_{ED} index, URA_{NED} indexes, and related URA values are not defined.

In this context, an "alert" is defined as any indication or characteristic of the conveying signal, as specified elsewhere in this document, which signifies to users that the conveying signal may be invalid or should not be used, such as the health bits not indicating operational-healthy, broadcasting non-standard code parity error, etc.

30.3.3.1.1.1 Transmission Week Number. Bits 39 through 51 of message type 10 shall contain 13 bits which are a modulo-8192 binary representation of the current GPS week number at the start of the data set transmission interval (see paragraph 6.2.4).

30.3.3.1.1.2 Signal Health (L1/L2/L5). The three, one-bit, health indication in bits 52 through 54 of message type 10 refers to the L1, L2, and L5 signals of the transmitting SV. The health of each signal is indicated by:

0 = Signal OK,
1 = Signal bad or unavailable.

The predicted health data will be updated at the time of upload when a new data set has been built by the CS. The transmitted health data may not correspond to the actual health of the transmitting SV.

Additional SV health data are given in the almanac in messages types 12, 31, and 37. The data given in message type 10 may differ from that shown in other messages of the transmitting SV and/or other SVs since the latter may be updated at a different time.
30.3.3.1.1.3 Data Predict Time of Week. Bits 55 through 65 of message type 10 shall contain the data predict time of week ($t_{op}$). The $t_{op}$ term provides the epoch time of week of the state estimate utilized for the prediction of satellite quasi-Keplerian ephemeris parameters.

30.3.3.1.1.4 Elevation-Dependent (ED) Accuracy. Bits 66 through 70 of message type 10 shall contain the elevation-dependent (ED) component User Range Accuracy (URA$_{ED}$) index for the standard positioning service user. The URA$_{ED}$ index shall provide the ED-related URA index or the current ephemeris curve fit interval. While the ED-related URA may vary over the ephemeris curve fit interval and over the satellite footprint, the URA$_{ED}$ index (N) in message type 10 shall correspond to the maximum URA$_{ED}$ expected over the entire ephemeris curve fit interval for the worst-case location within the SV footprint (i.e., nominally two points at the edge of the SV footprint). At the best-case location within the SV footprint (i.e., nominally directly below the SV along the SV nadir vector), the corresponding URA$_{ED}$ is zero.

The URA$_{ED}$ index is a signed, two’s complement integer in the range of +15 to -16 and has the following relationship to the ED URA:

-16 No accuracy prediction available-use at own risk

For each URA_{ED} index (N), users may compute a nominal URA_{ED} value (X) as given by:

- If the value of N is 6 or less, but more than -16, \( X = 2^{(1 + N/2)} \),

- If the value of N is 6 or more, but less than 15, \( X = 2^{(N - 2)} \),
• N = -16 or N = 15 shall indicate the absence of an accuracy prediction and shall advise the standard positioning service user to use that SV at his own risk.

For N = 1, 3, and 5, X should be rounded to 2.8, 5.7, and 11.3 meters, respectively.

The nominal $\text{URA}_{\text{ED}}$ value (X) is suitable for use as a conservative prediction of the RMS ED range errors for accuracy-related purposes in the pseudorange domain (e.g., measurement deweighting, RAIM, FOM computations). Integrity properties of the $\text{IAURA}_{\text{ED}}$ are specified with respect to the scaled (multiplied by either 4.42 or 5.73 as appropriate) upper bound values of the broadcast $\text{URA}_{\text{ED}}$ index (see 30.3.3.1.1).

For the nominal $\text{URA}_{\text{ED}}$ value and the $\text{IAURA}_{\text{ED}}$ value, users may compute an adjusted $\text{URA}_{\text{ED}}$ value as a function of SV elevation angle (E), for $E \geq 0$, as follows:

$$\text{Adjusted Nominal URA}_{\text{ED}} = \text{Nominal URA}_{\text{ED}} (\sin(E+90 \text{ degrees}))$$

$$\text{Adjusted IAURA}_{\text{ED}} = \text{IAURA}_{\text{ED}} (\sin(E+90 \text{ degrees}))$$

$\text{URA}_{\text{ED}}$ and $\text{IAURA}_{\text{ED}}$ account for SIS contributions to user range error which include, but are not limited to, the following: LSB representation/truncation error, alongtrack ephemeris errors, and crosstrack ephemeris errors. $\text{URA}_{\text{ED}}$ and $\text{IAURA}_{\text{ED}}$ do not account for user range error contributions due to the inaccuracy of the broadcast ionospheric data parameters used in the single-frequency ionospheric model or for other atmospheric effects.

30.3.3.1.2 Message Type 10 and 11 Ephemeris Parameter Characteristics. For each ephemeris parameter contained in message types 10 and 11, the number of bits, the scale factor of the least significant bit (LSB) (which is the last bit received), the range, and the units are as specified in Table 30-I. See Figures 30-1 and 30-2 for complete bit allocation in message types 10 and 11.

30.3.3.1.3 User Algorithm for Determination of SV Position. The user shall compute the ECEF coordinates of position for the SV’s antenna phase center (APC) utilizing a variation of the equations shown in Table 30-II. The ephemeris parameters are Keplerian in appearance; however, the values of these parameters are produced by the CS (Block IIR-M/IIF) and SS (GPS III) via a least squares curve fit of the predicted ephemeris of the SV APC (time-position quadruples: t, x, y, z expressed in ECEF coordinates). Particulars concerning the applicable coordinate system are given in Sections 20.3.3.4.3.3 and 20.3.3.4.3.4.

The sensitivity of the SV’s position to small perturbations in most ephemeris parameters is extreme. The sensitivity of position to the parameters A, $C_{xc,n}$, and $C_{yc,n}$ is about one meter/meter. The sensitivity of position to the angular parameters is on the order of $10^8$ meters/semi-circle, and to the angular rate parameters is on the order of $10^{12}$ meters/semi-circle/second. Because of this extreme sensitivity to angular perturbations, the value of $\pi$ used in the curve fit is given here. $\pi$ is a mathematical constant, the ratio of a circle’s circumference to its diameter. Here $\pi$ is taken as 3.1415926535898.

30.3.3.2 Message Types 30 Through 37 SV Clock Correction Parameters.

30.3.3.2.1 Message Type 30 Through 37 SV Clock Correction Parameter Content. The clock parameters in any one of message types 30 through 37 describe the SV time scale during the period of validity. The parameters are applicable during the time in which they are transmitted. Beyond that time, they are still applicable, however, the most recent data set should be used since the accuracy degrades over time.

The general format of message types 30 through 37 includes data fields for SV clock correction coefficients. Any one of message types 30 through 37 in conjunction with message types 10 and 11 provides users with the requisite data to correct SV time and to calculate SV position precisely. In general, any message type 30’s (i.e. 30-39) will provide SV clock correction parameters as described in this section.
30.3.3.2.1.1 **SV Clock Correction.** Any one of message types 30 through 37, Figure 30-3 through Figure 30-10, contains the parameters needed by the users for apparent SV clock correction. Bits 61 to 71 contain $t_{sc}$, clock data reference time of week. Bits 72 to 127 contain SV clock correction coefficients. The related algorithm is given in paragraph 20.3.3.3.3.1.

30.3.3.2.1.2 **Data Predict Time of Week.** Bits 39 through 49 of message types 30 through 37 shall contain the data predict time of week ($t_{sp}$). The $t_{sp}$ term provides the epoch time of week of the state estimate utilized for the prediction of SV clock correction coefficients.

30.3.3.2.2 **Clock Parameter Characteristics.** The number of bits, the scale factor of the LSB (which is the last bit received), the range, and the units of clock correction parameters shall be as specified in Table 30-III.

30.3.3.2.3 **User Algorithms for SV Clock Correction Data.** The algorithms defined in paragraph 20.3.3.3.3.1 allow all users to correct the code phase time received from the SV with respect to both SV code phase offset and relativistic effects. However, since the SV clock corrections of equations in paragraph 20.3.3.3.3.1 are estimated by the CS using dual frequency L1 and L2 P(Y) code measurements, the single-frequency L1 or L2 user and the dual-frequency L1 C/A - L2 C users must apply additional terms to the SV clock correction equations. These terms are described in paragraph 30.3.3.3.1.

* Parameters so indicated are two’s complement, with the sign bit (+ or -) occupying the MSB;

** See Figure 30-3 through 30-10 for complete bit allocation in Message types 30 to 37;

*** Unless otherwise indicated in this column, effective range is the maximum range attainable with indicated bit allocation and scale factor.

#### 30.3.2.4 Non-Elevation-Dependent (NED) Accuracy Estimates

Bits 50 through 54, and 55 through 57, and 58 through 60 of message types 30 through 37 shall contain the non-elevation-dependent (NED) component URA<sub>NED0</sub> Index, URA<sub>NED1</sub> Index, and URA<sub>NED2</sub> Index, respectively, of the SV (reference paragraph 6.2.1) for the standard positioning service user. The following equations together with the broadcast URA<sub>NED0</sub> Index, URA<sub>NED1</sub> Index, and URA<sub>NED2</sub> Index shall give the non-elevation dependent user range accuracy of IAURA<sub>NED</sub> over the current clock/ephemeris fit interval. While the actual NED related URA may vary over the satellite footprint, the IAURA<sub>NED</sub> calculated using the parameters in message type 10 at each instant during the current clock/ephemeris fit interval shall bound the maximum IAURA<sub>NED</sub> expected for the worst-case location within the satellite footprint at that instant.

The user shall calculate the NED-related URA with the equation (in meters);

---

164

IS-GPS-200F
21 Sep 2011
IAURA_{NED} = URA_{NED0} + URA_{NED1} (t - t_{op} + 604,800*(WN - WNop))

for \( t - t_{op} + 604,800*(WN - WNop) \leq 93,600 \) seconds

IAURA_{NED} = URA_{NED0} + URA_{NED1}^*(t - t_{op} + 604,800*(WN - WNop)) + URA_{NED2}^*(t - t_{op} + 604,800*(WN - WNop) - 93,600)^2

for \( t - t_{op} + 604,800*(WN - WNop) > 93,600 \) seconds

where

\( t \) is the GPS system time

WNop -- Data Predict Week Number, identifying the GPS week to which the top term refers. See Section 30.2.2.2.1.2 (Data Predict Time of Week).

The CS shall derive URA_{NED0}, URA_{NED1}, and URA_{NED2} indexes which, when used together in the above equations, results in the minimum IAURA_{NED} that is greater than the predicted IAURA_{NED} during the clock/ephemeris fit interval.

Non-elevation dependent URA (URA_{NED}) accounts for signal-in-space contributions to user range error that include, but are not limited to, the following: the net effect of clock parameter and code phase error in the transmitted signal for single-frequency L1C/A or single-frequency L2C users who correct the code phase as described in Section 30.3.3.3.1.1.1, as well as the net effect of clock parameter, code phase, and inter-signal correction error for dual-frequency L1/L2 and L1/L5 users who correct for group delay and ionospheric effects as described in Section 30.3.3.3.1.1.2.

The user shall use the broadcast URA_{NED0} index to derive the URA_{NED0} value. The URA_{NED0} index is a signed, two’s complement integer in the range of +15 to -16 and has the following relationship to the URA_{NED0} value:

</tbody>
</table>
For each $\text{URA}_{\text{NED}0}$ index (N), users may compute a nominal $\text{URA}_{\text{NED}0}$ value (X) as given by:

- If the value of N is 6 or less, but more than -16, $X = 2^{(1 + N/2)}$,
- If the value of N is 6 or more, but less than 15, $X = 2^{(N - 2)}$,
- N = -16 or N = 15 shall indicate the absence of an accuracy prediction and shall advise the standard positioning service user to use that SV at his own risk.

For N = 1, 3, and 5, X should be rounded to 2.8, 5.7, and 11.3 meters, respectively.

The nominal $\text{URA}_{\text{NED}0}$ value (X) shall be suitable for use as a conservative prediction of the RMS NED range errors for accuracy-related purposes in the pseudorange domain (e.g., measurement de-weighting RAIM, FOM computations). Integrity properties of the I\text{AURA}_{\text{NED}} are specified with respect to the scaled (multiplied by either 4.42 or 5.73 as appropriate) upper bound values of the $\text{URA}_{\text{NED}0}$ index, $\text{URA}_{\text{NED}1}$ index, and $\text{URA}_{\text{NED}2}$ index (see 30.3.3.1.1).

$\text{URA}_{\text{NED}0}$ accounts for zeroth order SIS-contributions to user range error which include, but are not limited to, the following: LSB representation/truncation error; the net effect of clock correction polynomial error and code phase error in the transmitted signal for single-frequency L1C/A or single-frequency L2C users who correct the code phase as described in Section 30.3.3.3.1.1; the net effect of clock parameter, code phase, and inter-signal correction error for dual-frequency L1/L2 and L1/L5 users who correct for group delay and ionospheric effects as described in Section 30.3.3.3.1.1.2; radial ephemeris error; anisotropic antenna errors; and signal deformation error. $\text{URA}_{\text{NED}}$ does not account for user range contributions due to the inaccuracy of the broadcast ionospheric data parameters used in the single-frequency ionospheric model or for other atmospheric effects.

The transmitted $\text{URA}_{\text{NED}1}$ index is an integer value in the range 0 to 7. The $\text{URA}_{\text{NED}1}$ index has the following relationship to the $\text{URA}_{\text{NED}1}$ value:

$$\text{URA}_{\text{NED}1} = \frac{1}{2^N} \text{ (meters/second)}$$

where

$$N = 14 + \text{URA}_{\text{NED}1} \text{ Index}$$
The transmitted $\text{URA}_{\text{NED2}}$ index is an integer value in the range 0 to 7. $\text{URA}_{\text{NED2}}$ index has the following relationship to the $\text{URA}_{\text{NED2}}$:

$$\text{URA}_{\text{NED2}} = \frac{1}{2^N} \text{ (meters/second}^2)$$

where

$$N = 28 + \text{URA}_{\text{NED2}} \text{ Index.}$$

30.3.3.3 Message Type 30 Ionospheric and Group Delay Correction Parameters.

30.3.3.3.1 Message Type 30 Ionospheric and Group Delay Correction Parameter Content. Message type 30 provides SV clock correction parameters (ref. Section 30.3.3.2) and ionospheric and group delay correction parameters. Bits 128 through 192 of message type 30 provide the group delay differential correction terms for L1, L2, and L5 signal users. Bits 193 through 256 provide the ionospheric correction parameters for single frequency users. The following algorithms shall apply when interpreting the correction parameters in the message.

The broadcast group delay differential correction terms apply to the pseudorange measurements produced by an ideal correlation receiver with a bandwidth of 20.46 MHz centered at the reference waveform nominal frequency whose phase is linear over that bandwidth using an exact replica of the reference waveform in an early-late discriminator having a correlator spacing of 97.75 nanoseconds. The group delay differential correction terms may not apply to pseudorange measurements produced by different methods due to potential distortion of the transmitted waveform. Users employing pseudorange measurement methods different from the defined method must account for the potential inapplicability of the group delay differential correction terms.

30.3.3.3.1.1 Estimated L1-L2 Group Delay Differential. The group delay differential correction terms, $T_{GD}$, $\text{ISC}_{L1C/A}$, $\text{ISC}_{L2C}$ for the benefit of single frequency L1 P, L1 C/A, L2 P, L2 C users and dual frequency L1/L2 users are contained in bits 128 through 166 of message type 30 (see Figure 30-3 for complete bit allocation). The bit length, scale factors, ranges, and units of these parameters are given in Table 30-IV. The bit string of “10000000000000” shall indicate that the group delay value is not available. The related algorithm is given in paragraphs 30.3.3.3.1.1.1 and 30.3.3.3.1.1.2.

* Parameters so indicated are two’s complement with the sign bit (+ or -) occupying the MSB;
** See Figure 30-3 for complete bit allocation in Message type 30;
*** Effective range is the maximum range attainable with indicated bit allocation and scale factor;
**** The bit string of “1000000000000” will indicate that the group delay value is not available.

30.3.3.3.1.1 Inter-Signal Correction. The correction terms, $T_{GD}$, ISC$_{L1C/A}$ and ISC$_{L2C}$, are initially provided by the CS to account for the effect of inter-signal biases between L1 P(Y) and L2 P(Y), L1 P(Y) and L1 C/A, and between L1 P(Y) and L2 C, respectively, based on measurements made by the SV contractor during SV manufacture. The values of $T_{GD}$ and ISCs for each SV may be subsequently updated to reflect the actual on-orbit group delay differential. For maximum accuracy, the single frequency L1 C/A user must use the correction terms to make further modifications to the code phase offset in paragraph 20.3.3.3.3.1 with the equation:

$$(\Delta t_{SV})_{L1C/A} = \Delta t_{SV} - T_{GD} + ISC_{L1C/A}$$

where $T_{GD}$ (see paragraph 20.3.3.3.3.2) and ISC$_{L1C/A}$ are provided to the user as Message Type 30 data, described in paragraph 30.3.3.3.1.1. For the single frequency L2 C user, the code phase offset modification is given by:

$$(\Delta t_{SV})_{L2C} = \Delta t_{SV} - T_{GD} + ISC_{L2C}$$

where, ISC$_{L2C}$ is provided to the user as Message Type 30 data.
The values of $\text{ISC}_{L1C/A}$ and $\text{ISC}_{L2C}$ are measured values that represent the mean SV group delay differential between the L1 P(Y)-code and the L1 C/A- or L2 C-codes respectively as follows,

$$
\text{ISC}_{L1C/A} = t_{L1P(Y)} - t_{L1C/A}
$$

$$
\text{ISC}_{L2C} = t_{L1P(Y)} - t_{L2C}
$$

where, $t_{\text{Lix}}$ is the GPS time the $i^{th}$ frequency $x$ signal (a specific epoch of the signal) is transmitted from the SV antenna phase center.

30.3.3.3.1.1.2 L1/L2 Ionospheric Correction. The two frequency (L1 C/A and L2 C) user shall correct for the group delay and ionospheric effects by applying the relationship:

$$
PR = \frac{(PR_{L2C} - \gamma_{12} PR_{L1C/A}) + c (\text{ISC}_{L2C} - \gamma_{12} \text{ISC}_{L1C/A})}{1 - \gamma_{12}} - c T_{GD}
$$

where,

- $PR =$ pseudorange corrected for ionospheric effects,
- $PR_i =$ pseudorange measured on the channel indicated by the subscript,
- $\text{ISC}_i =$ inter-signal correction for the channel indicated by the subscript (see paragraph 30.3.3.3.1.1),
- $T_{GD} =$ see paragraph 20.3.3.3.3.2,
- $c =$ speed of light,

and where, denoting the nominal center frequencies of L1 and L2 as $f_{L1}$ and $f_{L2}$ respectively,

$$
\gamma_{12} = \left(\frac{f_{L1}}{f_{L2}}\right)^2 = \left(\frac{1575.42}{1227.6}\right)^2 = \left(\frac{77}{60}\right)^2.
$$
30.3.3.1.2 Ionospheric Data. The ionospheric parameters which allow the “L1 only” or “L2 only” user to utilize the ionospheric model for computation of the ionospheric delay are contained in Message Type 30. The “one frequency” user should use the model given in paragraph 20.3.3.5.2.5 to make this correction for the ionospheric effects. The bit lengths, scale factors, ranges, and units of these parameters are given in Table 20-X.

The ionospheric data shall be updated by the CS at least once every six days while the CS is able to upload the SVs. If the CS is unable to upload the SVs, the ionospheric data transmitted by the SVs may not be accurate.
30.3.3.4 **Message Types 31, 12 and 37 Almanac Types.** The almanac parameters are provided in any one of message types 31, 37, and 12. Message type 37 provides Midi almanac parameters and the reduced almanac parameters are provided in either message type 31 or type 12. The SV shall broadcast both message types 31 (and/or 12) and 37. However, the reduced almanac parameters (i.e. message types 31 and/or 12) for the complete set of SVs in the constellation will be broadcast by a SV using shorter duration of time compared to the broadcast of the complete set of Midi almanac parameters (i.e. message type 37). The parameters are defined below, followed by material pertinent to the use of the data. 

30.3.3.4.1 **Almanac Reference Week.** Bits 39 through 51 of message type 12, and bits 128 through 140 of message types 31 and 37 shall indicate the number of the week (WN<sub>a-n</sub>) to which the almanac reference time (t<sub>oa</sub>) is referenced (see paragraph 20.3.3.5.2.2). The WN<sub>a-n</sub> term consists of 13 bits which shall be a modulo-8192 binary representation of the GPS week number (see paragraph 6.2.4) to which the t<sub>oa</sub> is referenced. Bits 52 through 59 of message type 12, and bits 141 to 148 of message types 31 and 37 shall contain the value of t<sub>oa</sub>, which is referenced to this WN<sub>a-n</sub>. 

30.3.3.4.2 **Almanac Reference Time.** See paragraph 20.3.3.5.2.2. 

30.3.3.4.3 **SV PRN Number.** Bits 149 through 154 of message type 37 and bits 1 through 6 in each packet of reduced almanac shall specify PRN number of the SV whose almanac or reduced almanac, respectively, is provided in the message or in the packet. 

30.3.3.4.4 **Signal Health (L1/L2/L5).** The three, one-bit, health indication in bits 155, 156, and 157 of message type 37 and bits 29,30 and 31 of each packet of reduced almanac refers to the L1, L2, and L5 signals of the SV whose PRN number is specified in the message or in the packet. For each health indicator, a “0” signifies that all navigation data are okay and “1” signifies that some or all navigation data are bad. The predicted health data will be updated at the time of upload when a new reduced almanac has been built by the CS. The transmitted health data may not correspond to the actual health of the transmitting SV or other SVs in the constellation. 

30.3.3.4.5 **Midi Almanac Parameter Content.** Message type 37, Figure 30-10, provides Midi almanac data for a SV whose PRN number is specified in the message. The number of bits, the scale factor (LSB), the range, and the units of the almanac parameters are given in Table 30-V. The user algorithm is essentially the same as the user algorithm used for computing the precise ephemeris as specified in Table 20-IV. Other parameters appearing in the equations of Table 20-IV, but not provided by the Midi almanac with the reference values, are set to zero for SV position determination. See paragraph 20.3.3.5.2.3 for almanac time parameters. 

30.3.3.4.6 **Reduced Almanac Parameter Content.** Message type 31, Figure 30-4, provides SV clock correction parameters (ref. Section 30.3.3.2) and reduced almanac data packets for 4 SVs. Message type 12, Figure 30-11, contains reduced almanac data packets for 7 SVs. 

172
30.3.3.4.6.1 **Reduced Almanac Data.** Message type 31 or 12 contains reduced almanac data and SV health words for SVs in the constellation. The reduced almanac data of a SV is broadcast in a packet of 31 bits long, as described in Figure 30-15. The reduced almanac data are a subset of the almanac data which provide less precise ephemeris. The reduced almanac data values are provided relative to pre-specified reference values. The number of bits, the scale factor (LSB), the range, and the units of the reduced almanac parameters are given in Table 30-VI. The algorithms and other material related to the use of the reduced almanac data are given in Section 30.3.3.4.6.2.

The reduced almanac parameters shall be updated by the CS at least once every 3 days while the CS is able to upload the SVs. If the CS is unable to upload the SVs, the accuracy of the reduced almanac parameters transmitted by the SVs will degrade over time.

30.3.3.4.6.2 **Reduced Almanac Packet.** The following shall apply when interpreting the data provided in each packet of reduced almanac (see Figure 30-15).

The reduced almanac data is provided in bits 7 through 28 of each packet. The data from a packet along with the reference values (see Table 30-VI) provide ephemeris with further reduced precision. The user algorithm is essentially the same as the user algorithm used for computing the precise ephemeris from the parameters of the message types 10 and 11 (see paragraph 30.3.3.1.3 and Table 30-II). Other parameters appearing in the equations of Table 30-II, but not provided by the reduced almanac with the reference values, are set to zero for SV position determination.

\( \Omega = -2.6 \times 10^9 \) semi-circles/second.

30.3.3.5 Message Type 32 Earth Orientation Parameters (EOP). The earth orientation parameters are provided in message type 32. The parameters are defined below, followed by material pertinent to the use of the data.
30.3.3.5.1 **EOP Content.** Message type 32, Figure 30-5, provides SV clock correction parameters (ref. Section 30.3.3.2) and earth orientation parameters. The EOP message provides users with parameters to construct the ECEF and ECI coordinate transformation (a simple transformation method is defined in Section 20.3.3.4.3.3.2). The number of bits, scale factors (LSBs), the range, and the units of all EOP fields of message type 32 are given in Table 30-VII.

30.3.3.5.1.1 **User Algorithm for Application of the EOP.** The EOP fields in the message type 32 contain the EOP data needed to construct the ECEF-to-ECI coordinate transformation. The user computes the ECEF position of the SV antenna phase center using the equations shown in Table 30-II. The full coordinate transformation for translating to the corresponding ECI SV antenna phase center position may be accomplished in accordance with the computations detailed in Chapter 5 of IERS Technical Note 36: IERS Conventions (2010) and equations for UT1, \( x_p \) and \( y_p \) as documented in Table 30-VIII. Figure 5.1 on page 73 of that document depicts the computational flow starting from GCRS (Geocentric Celestial Reference System) to ITRS (International Terrestrial Reference System). Ongoing WGS 84 re-adjustment at NGA and incorporating the 2010 IERS Conventions, are expected to bring Earth based coordinate agreement to within 2 cm. In the context of the Conventions, the user may as a matter of convenience choose to implement the transformation computations via either the Celestial Intermediate Origin (CIO) based approach” or the “Equinox based approach”. The EOP parameters for \( \Delta UT1 \) are to be applied within the “Rotation to terrestrial system” process, and the parameters for \( x_p \) and \( y_p \) are applied in the “Rotation for polar motion” process. Users are advised that the broadcast message type 32 EOP parameters already account for zonal, diurnal and semidiurnal effects (described in Chapter 8 of the IERS Conventions (2010)), so these effects should not be further applied by the user.

The relevant computations utilize elementary rotation matrices \( R_i(\alpha) \), where \( \alpha \) is a positive rotation about the \( i^{th} \)-axis ordinate, as follows:

\[
R_1(\alpha) = \begin{bmatrix} 1 & 0 & 0 \\ 0 & \cos(\alpha) & \sin(\alpha) \\ 0 & -\sin(\alpha) & \cos(\alpha) \end{bmatrix}, \quad R_2(\alpha) = \begin{bmatrix} \cos(\alpha) & 0 & -\sin(\alpha) \\ 0 & 1 & 0 \\ \sin(\alpha) & 0 & \cos(\alpha) \end{bmatrix}
\]

\[
R_3(\alpha) = \begin{bmatrix} \cos(\alpha) & \sin(\alpha) & 0 \\ -\sin(\alpha) & \cos(\alpha) & 0 \\ 0 & 0 & 1 \end{bmatrix}
\]
The Inertial-to-Geodetic rotation matrix shall be calculated in accordance with the computations detailed in Chapter 5 of IERS Technical Note 36: IERS Conventions (2010) and equations for UT1, x_p and y_p as documented in Table 30-VIII.

$t$ is GPS system time at time of transmission, i.e., GPS time corrected for transit time (range/speed of light).

30.3.3.6 Message Type 33 Coordinated Universal Time (UTC) Parameters. Message type 33, Figure 30-6 contains the UTC parameters. The contents of message type 33 are defined below, followed by material pertinent to the use of the UTC data.

30.3.3.6.1 UTC Parameter Content. Message type 33 provides SV clock correction parameters (ref. Section 30.3.3.2) and also, shall contain the parameters related to correlating UTC (USNO) time with GPS Time. The bit lengths, scale factors, ranges, and units of these parameters are given in Table 30-IX. See Figure 30-6 for complete bit allocation in message type 33.

The parameters relating GPS time to UTC (USNO) shall be updated by the CS at least once every three days while the CS is able to upload the SVs. If the CS is unable to upload the SVs, the accuracy of the UTC parameters transmitted by the SVs will degrade over time.

30.3.3.6.2 UTC and GPS Time. Message type 33 includes: (1) the parameters needed to relate GPS Time to UTC (USNO), and (2) notice to the user regarding the scheduled future or recent past (relative to Nav message upload) value of the delta time due to leap seconds ($\Delta t_{LS}$), together with the week number ($WN_{LS}$) and the day number (DN) at the end of which the leap second becomes effective. Information required to use these parameters to calculate $t_{UTC}$ is in paragraph 20.3.3.5.2.4 except the following definition of $\Delta t_{UTC}$ shall be used.

$$\Delta t_{UTC} = \Delta t_{LS} + A_{0,n} + A_{1,n} (t_E - t_{ot} + 604800 (WN - WN_{ot})) + A_{2,n} (t_E - t_{ot} + 604800 (WN - WN_{ot}))^2$$ seconds

**** Right justified.
30.3.3.7 **Message Types 34, 13, and 14 Differential Correction Parameters.** Differential Correction (DC) parameters are provided either in message types 34 or in types 13 and 14. These parameters provide users with sets of correction terms that apply to the clock and ephemeris data transmitted by *other* SVs. DC parameters are grouped in packets, as described in the next sections. The availability of these message types is subject to the control and determination of the CS.

30.3.3.7.1 **Differential Correction Parameters Content.** Message type 34 provides SV clock correction parameters (ref. Section 30.3.3.2) and also, shall contain DC parameters that apply to the clock and ephemeris data transmitted by another SV. One message type 34, Figure 30-7, shall contain 34 bits of clock differential correction (CDC) parameters and 92 bits of ephemeris differential correction (EDC) parameters for one SV other than the transmitting SV. Bit 150 of message type 34 shall be a DC Data Type indicator that indicates the data type for which the DC parameters apply. Zero (0) signifies that the corrections apply to CNAV data, \( D_c(t) \), and one (1) signifies that the corrections apply to NAV data, \( D(t) \).

Message types 13 and 14 together also provide DC parameters. Message type 13, Figure 30-12, shall contain CDC parameters applicable to 6 SVs and message type 14, Figure 30-13, shall contain EDC parameters applicable to 2 SVs. There shall be a DC Data Type indicator preceding each CDC or EDC packet. The content of an individual data packet is depicted in Figure 30-16. The number of bits, scale factors (LSB), the range, and the units of all fields in the DC packet are given in Table 30-X.
30.3.3.7.2 **DC Data Packet.** Each DC data packet contains: corrections to SV clock polynomial coefficients provided in any one of the message types 30 to 37 of the corresponding SV; corrections to quasi-Keplerian elements referenced to \( t_{OD} \) of the corresponding SV; and User Differential Range Accuracy (UDRA) and UDRA indices that enable users to estimate the accuracy obtained after corrections are applied. Each DC packet is made up of two different segments. The first segment contains 34 bits for the CDC parameters and the second segment contains 92 bits of EDC parameters totaling 126 bits. The CDC and EDC parameters form an indivisible pair and users must utilize CDC and EDC as a pair. Users must utilize CDC and EDC data pair of same \( t_{OP-D} \) and of same \( t_{OD} \).

30.3.3.7.2.1 **Differential Correction Data Predict Time of the Week.** The DC data predict time of week \( (t_{OP-D}) \) provides the epoch time of week, in increments of 300 seconds (i.e. five minutes), at which the prediction for the associated DC data was performed.

30.3.3.7.2.2 **Time of Differential Correction Data.** The time of DC data, \( t_{OD} \), specifies the reference time of week, in increments of 300 seconds (i.e., five minutes) relative to the GPS week, for the associated CDC and EDC data.

30.3.3.7.2.3 **SV PRN Identification.** The PRN ID of both CDC and EDC of Figure 30-16 identifies the satellite to which the subject 126-bit differential correction packet data applies (by PRN code assignment). A value of all ones “11111111” in any PRN ID field shall indicate that no DC data is contained in the remainder of the data block. In this event, the remainder of the data block shall be filler bits, i.e., alternating ones and zeros beginning with one.

*** Unless otherwise indicated in this column, effective range is the maximum range attainable with indicated bit allocation and scale factor.

30.3.3.7.3 Application of Clock Related DC Data. The SV PRN code phase offset, uncorrected by clock correction coefficient updates, is given by equation 2 in paragraph 20.3.3.3.3.1 (see para. 30.3.3.2.3). If the matched pair of DC data for the subject SV is available, the user may apply clock correction coefficient update values by:

\[ \Delta t_{sv} = (a_0 + \delta a_0) + (a_{f1} + \delta a_{f1})(t - t_0) + a_{f2}(t - t_0)^2 + \Delta t_r, \]
where $\delta a_{0}$ and $\delta a_{1}$, (see Table 30-X), are given in message types 34 or 13, and all other terms are as stated in paragraph 20.3.3.3.3.1.  Clock-related DC data shall not be applied to any SV transmitting clock correction parameters message(s) containing a $t_{op}$ value greater than the $t_{op-D}$ value of messages types 34 or 13 containing the clock-related DC data.

30.3.3.7.4 Application of Orbit-Related DC Data. The DC data packet includes corrections to parameters that correct the state estimates for ephemeris parameters transmitted in the message types 10 and 11 (broadcast by the SV to which the DC data packet applies). The user will update the ephemeris parameters utilizing a variation of the algorithm expressed in the following equations. The user will then incorporate the updated quasi-Keplerian element set in all further calculations of SV position, as represented by the equations in Table 30-II (see para. 30.3.3.1.3). Ephemeris-related DC data shall not be applied to any SV transmitting message types 10 and 11 containing a $t_{op}$ value greater than the $t_{op-D}$ value of message types 34 or 14 containing the ephemeris-related DC data.

The user will construct a set of initial (uncorrected) elements by:

\[
\begin{align*}
A_i & = A_0 \\
\epsilon_i & = \epsilon_n \\
\nu_i & = \nu_{0-n} \\
\Omega_i & = \Omega_{0-n} \\
\alpha_i & = \epsilon_n \cos(\omega_n) \\
\beta_i & = \epsilon_n \sin(\omega_n) \\
\gamma_i & = M_{0-n} + \omega_n
\end{align*}
\]

where $A_0$, $\epsilon_n$, $\nu_{0-n}$, $\omega_n$, and $M_{0-n}$ are obtained from the applicable SV’s message types 10 and 11 data. The terms $\alpha_i$, $\beta_i$, and $\gamma_i$ form a subset of stabilized ephemeris elements which are subsequently corrected by $\Delta \alpha$, $\Delta \beta$ and $\Delta \gamma$—the values of which are supplied in the message types 34 or 14 - as follows:

\[
\begin{align*}
\alpha_c & = \alpha_i + \Delta \alpha \\
\beta_c & = \beta_i + \Delta \beta \\
\gamma_c & = \gamma_i + \Delta \gamma
\end{align*}
\]

The quasi-Keplerian elements are then corrected by
\[ A_c = A_i + \Delta A \]
\[ e_c = (\alpha_c^2 + \beta_c^2)^{1/2} \]
\[ i_c = i_i + \Delta i \]
\[ \Omega_c = \Omega_i + \Delta \Omega \]
\[ \omega_c = \tan^{-1}(\beta_i/\alpha_i) \]
\[ M_{0,c} = \gamma_c - \omega_c + \Delta M_0 \]

where \( \Delta A, \Delta i \) and \( \Delta \Omega \) are provided in the EDC data packet of the message type 34 or 14 and \( \Delta M_0 \) is obtained from

\[ \Delta M_0 = -3 \frac{\sqrt{\mu}}{A_c^2} \left[ (t_{se}) - (t_{OD}) \right]. \]

The corrected quasi-Keplerian elements above are applied to the user algorithm for determination of antenna phase center position in Section 30.3.3.1.3, Table 30-II.

### 30.3.3.7.5 SV Differential Range Accuracy Estimates
The UDRA \( \text{op-D} \) and UDRA shall give the differential user range accuracy for the SV. It must be noted that the two parameters provide estimated accuracy after both clock and ephemeris DC are applied. The UDRA \( \text{op-D} \) and UDRA indices are signed, two’s complement integers in the range of +15 to -16 and has the following relationship:

<table>

For any time, $t_k$, other than $t_{op-D}$, UDRA is found by,

$$UDRA = UDRA_{op-D} + UDRA (t_k - t_{op-D})$$

30.3.3.8 Message Type 35 GPS/GNSS Time Offset.  Message type 35, Figure 30-8, contains the GPS/Global Navigation Satellite System (GNSS) Time Offset (GGTO) parameters. The contents of message type 35 are defined below. The validity period of the GGTO shall be 1 day as a minimum.

30.3.3.8.1 GPS/GNSS Time Offset Parameter Content. Message Type 35 provides SV clock correction parameters (ref. Section 30.3.3.2) and also, shall contain the parameters related to correlating GPS time with other GNSS time. Bits 155 through 157 of message type 35 shall identify the other GPS like navigation system to which the offset data applies. The three bits are defined as follows;

- 000 = no data available,
- 001 = Galileo,
- 010 = GLONASS,
- 011 through 111 = reserved for other systems.

The number of bits, the scales factor (LSB), the range, and the units of the GGTO parameters are given in Table 30-XI. See Figure 30-8 for complete bit allocation in message type 35.
30.3.3.8.2 GPS and GNSS Time. The GPS/GNSS-time relationship is given by,

\[ t_{\text{GNSS}} = t_E - (A_{0\text{GGTO}} + A_{1\text{GGTO}} (t_E - t_{\text{GGTO}} + 604800 (WN - WN_{\text{GGTO}})) + A_{2\text{GGTO}} (t_E - t_{\text{GGTO}} + 604800 (WN - WN_{\text{GGTO}}))^2) \]

where \( t_{\text{GNSS}} \) is in seconds, \( t_E \) and WN are as defined in Section 20.3.3.2, and the remaining parameters are as defined in Table 30-XI.

* Parameters so indicated shall be two’s complement with the sign bit (+ or -) occupying the MSB;

** See Figure 30-8 for complete bit allocation;

*** Unless otherwise indicated in this column, effective range is the maximum range attainable with indicated bit allocation and scale factor.

30.3.3.9 Message Types 36 and 15 Text Messages. Text messages are provided either in message type 36, Figure 30-9, or type 15, Figure 30-14. The specific contents of text message will be at the discretion of the Operating Command.

Message type 36 can accommodate the transmission of 18 eight-bit ASCII characters.

Message type 15 can accommodate the transmission of 29 eight-bit ASCII characters.
The requisite bits shall occupy bits 39 through 274 of message type 15 and bits 128 through 275 of message type 36. The eight-bit ASCII characters shall be limited to the set described in paragraph 20.3.3.5.1.8.

30.3.4 Timing Relationships. The following conventions shall apply.

30.3.4.1 Paging and Cutovers. Broadcast system of messages is completely arbitrary, but sequenced to provide optimum user performance. Message types 10 and 11 shall be broadcast at least once every 48 seconds. All other messages shall be broadcast in-between, not exceeding the maximum broadcast interval in Table 30-XII. Message type 15 will be broadcast as needed, but will not reduce the maximum broadcast interval of the other messages. Type 15 messages that are longer than one page will not necessarily be broadcast consecutively.

</table>

* Also contains SV clock correction parameters.
** Complete set of SVs in the constellation.
*** When Differential Corrections are available.
† The intervals specified are maximum. As such, the broadcast intervals may be shorter than the specified value.
30.3.4.2 **SV Time vs. GPS Time.** In controlling the SVs and uploading of data, the CS shall allow for the following timing relationships:

- a. Each SV operates on its own SV time;
- b. All time-related data (TOW) in the messages shall be in SV-time;
- c. All other data in the Nav message shall be relative to GPS time;
- d. The acts of transmitting the Nav messages shall be executed by the SV on SV time.

30.3.4.3 **Speed of Light.** The speed of light used by the CS for generating the data described in the above paragraphs is

\[ c = 2.99792458 \times 10^8 \] meters per second

which is the official WGS 84 speed of light. The user shall use the same value for the speed of light in all computations.

30.3.4.4 **Data Sets.** The \( t_{oc} \) shall be equal to the \( t_{oc} \) of the same CNAV data set. The following rules govern the transmission of \( t_{oc} \) and \( t_{ec} \) values in different data sets: (1) The transmitted \( t_{oc} \) will be different from any value transmitted by the SV during the preceding seven days; (2) The transmitted \( t_{ec} \) will be different from any value transmitted by the SV during the preceding six hours.

Cutovers to new data sets will occur only on hour boundaries except for the first data set of a new upload. The first data set may be cut-in (reference paragraph 30.3.4.1) at any time during the hour and therefore may be transmitted by the SV for less than one hour.

The start of the transmission interval for each data set corresponds to the beginning of the curve fit interval for the data set. Each data set remains valid for the duration of its transmission interval, and nominally also remains valid for the duration of its curve fit interval. A data set is rendered invalid before the end of its curve fit interval when it is superseded by the SV cutting over to the first data set of a new upload.

**Normal Operations.** The message type 10, 11, and 30-37 data sets are transmitted by the SV for periods of two hours. The corresponding curve fit interval is three hours.
30.3.4.5 **Reference Times.** The LNAV reference time information in paragraph 20.3.4.5 also applies to the CNAV reference times.

30.3.5 **Data Frame Parity.** The data signal contains parity coding according to the following conventions.

30.3.5.1 **Parity Algorithm.** Twenty-four bits of CRC parity will provide protection against burst as well as random errors with a probability of undetected error \( \leq 2^{-24} = 5.96 \times 10^{-8} \) for all channel bit error probabilities \( \leq 0.5 \). The CRC word is calculated in the forward direction on a given message using a seed of 0. The sequence of 24 bits \((p_1,p_2,\ldots,p_{24})\) is generated from the sequence of information bits \((m_1,m_2,\ldots,m_{276})\) in a given message. This is done by means of a code that is generated by the polynomial

\[
g(X) = \sum_{i=0}^{24} g_i X^i
\]

where

\[
g_i = 1 \quad \text{for} \quad i = 0,1,3,4,5,6,7,10,11,14,17,18,23,24
\]
\[
g_i = 0 \quad \text{otherwise}
\]

This code is called CRC-24Q. The generator polynomial of this code is in the following form (using binary polynomial algebra):

\[
g(X) = (1 + X)p(X)
\]

where \(p(X)\) is the primitive and irreducible polynomial

\[
p(X) = X^{23} + X^{17} + X^{13} + X^{12} + X^{11} + X^9 + X^8 + X^7 + X^5 + X^3 + 1
\]

When, by the application of binary polynomial algebra, the above \(g(x)\) is divided into \(m(x)x^{24}\), where the information sequence \(m(x)\) is expressed as

\[
m(X) = m_k + m_{k-1}X + m_{k-2}X^2 + \cdots + m_0X^{k-1}
\]
The result is a quotient and a remainder \( R(x) \) of degree < 24. The bit sequence formed by this remainder represents the parity check sequence. Parity bit \( p_i \), for any \( i \) from 1 to 24, is the coefficient of \( x^{24-i} \) in \( R(x) \).

This code has the following characteristics:

1) It detects all single bit errors per code word.

2) It detects all double bit error combinations in a codeword because the generator polynomial \( g(X) \) has a factor of at least three terms.

3) It detects any odd number of errors because \( g(X) \) contains a factor \( 1+X \).

4) It detects any burst error for which the length of the burst is \( \leq 24 \) bits.

5) It detects most large error bursts with length greater than the parity length \( r = 24 \) bits. The fraction of error bursts of length \( b > 24 \) that are undetected is:

   a) \( 2^{-24} = 5.96 \times 10^{-8} \), if \( b > 25 \) bits.

   b) \( 2^{-23} = 1.19 \times 10^{-7} \), if \( b = 25 \) bits.
40. APPENDIX IV GPS NAVIGATION DATA STRUCTURE FOR LNAV DATA, D(t), FOR PRN 33-63

40.1 Scope. This appendix describes the specific legacy navigation (LNAV) data structure denoted by data ID number 2 for the upper set of PRN numbers (PRN 33-63). This data ID number, when transmitted as part of the LNAV data, shall be represented by the two-bit binary notation as 01. Data ID number 1 is no longer in use. The LNAV data structure for the upper set of PRN numbers is denoted as LNAV-U. The LNAV data structure for the lower set of PRN numbers (LNAV-L) is described in Appendix II.

40.2 Applicable Documents. Applicable documents shall be as specified in Appendix II, Section 20.2.

40.3 Requirements

40.3.1 Data Characteristics. The data characteristics shall be as specified in Appendix II, Section 20.3.1.

40.3.2 Message Structure. The message structure shall be as specified in Appendix II, Section 20.3.2 except as indicated by Figure 40-1.

Figure 40-1. Data Format (sheet 11 of 11)
40.3.3 Message Content. The format and contents of the TLM word and the HOW, as well as those of words three through ten of each subframe/page, are described in the following subparagraphs. The timing of the subframes and pages is covered in Section 40.3.4.

40.3.3.1 Telemetry Word. The TLM word shall be as specified in Appendix II, Section 20.3.3.1.

40.3.3.2 Handover Word (HOW). The HOW shall be as specified in Appendix II, Section 20.3.3.2.

40.3.3.3 Subframe 1. Subframe 1 shall be as specified in Appendix II, Section 20.3.3.3.

40.3.3.4 Subframes 2 and 3. Subframes 2 and 3 shall be as specified in Appendix II, Section 20.3.3.4.

40.3.3.5 Subframes 4 and 5. Both subframe 4 and 5 are subcommutated 25 times each; the 25 versions of these subframes are referred to as pages 1 through 25 of each subframe. With the possible exception of "reserved for system use" pages and explicit repeats, each page contains different specific data in words three through ten. As shown in Figure 40-1, the pages of subframe 4 utilize seven different formats, while those of subframe 5 use two. The content of words three through ten of each page is described below, followed by algorithms and material pertinent to the use of the data.

40.3.3.5.1 Content of Subframes 4 and 5. Words three through ten of each page contain six parity bits as their LSBs; in addition, two non-information bearing bits are provided as bits 23 and 24 of word ten in each page for parity computation purposes. The data contained in the remaining bits of words three through ten of the various pages in subframes 4 and 5 are described in the following subparagraphs.

A brief summary of the various data contained in each page of subframes 4 and 5 is as follows:

a. Subframe 4:
   · Pages 1, 6, 11, 16 and 21: (reserved);
   · Pages 2, 3, 4, 5, 7, 8, and 9: almanac data for SV ID 89 through 95 (PRN 57 through 63) respectively;
   · Page 10: (reserved);
   · Pages 12, 19, 20, 22, 23 and 24: (reserved);
   · Page 13: NMCT;
   · Pages 14 and 15: reserved for system use;
   · Page 17: special messages;
   · Page 18: ionospheric and UTC data;
· Page 25:  A-S flags/SV configurations for 31 SVs, plus SV health for SV ID 89 through 95 (PRN 57 through 63).

b. Subframe 5:

· Pages 1 through 24:  almanac data for SV ID 65 through 88 (PRN 33 through 56);

· Page 25:  SV health data for SV ID 65 through 88 (PRN 33 through 56), the almanac reference time, the almanac reference week number.

40.3.3.5.1.1 Data ID and SV ID.  The two MSBs of word three in each page shall contain the data ID.  Data ID number two (denoted by binary code 01) denotes the LNAV data structure of D(t) which is described in this Appendix.  Future data IDs will be defined as necessary.

As shown in Table 40-V, the data ID is utilized to provide one of two indications:  (a) for those pages which are assigned to contain the almanac data of one specific SV, the data ID defines the data structure utilized by that SV whose almanac data are contained in that page; and (b) for all other pages, the data ID denotes the data structure of the transmitting SV.

The six LSBs of the SV ID are given by bits three through eight of word three in each page as shown in Table 40-V.  Specific IDs are reserved for each page of subframes 4 and 5.  The SV IDs are utilized in two different ways:  (a) for those pages which contain the almanac data of a given SV, the SV ID is equal to 32 plus the number that is assigned to the PRN code phase of that SV (reference Tables 3-Ia and 3-Ib), and (b) for all other pages the SV ID assigned in accordance with Table 40-V serves as the "page ID".  IDs 65 through 95 are assigned to those pages which contain the almanac data of specific SVs (pages 1-24 of subframe 5 and pages 2-5 and 7-9 of subframe 4).  The "0" ID (binary all zeros) is assigned to indicate a dummy SV, while IDs 115 through 127 are utilized for pages containing other than almanac data of a specific SV.  IDs 116 through 126 have the same data as LNAV-L IDs 52 through 62.  ID 115 is the LNAV-U analog of ID 51 in LNAV-L, while ID 127 is the LNAV-U analog of ID 63 in LNAV-L.

Pages which carry the same SV ID (e.g., in subframe 4, pages 1, 6, 11, 16 and 21 carry an ID of 121, while pages 12 and 24 are designated by an ID of 126) may not be considered to contain identical data.  The data in the pages with the same SV ID can be different.  Pages 1, 6, 11, 16 and 21 reference Appendix II.  Pages 12, 19, 20, 22, 23 and 24 reference Appendix II.  Pages 14 and 15: (Reference Appendix II)

</table>

* Use "0" to indicate "dummy" SV. When using "0" to indicate dummy SV, use the data ID of the transmitting SV.

Note 1: Data ID of that SV whose SV ID appears in that page.

Note 2: Data ID of transmitting SV.

Note 3: SV ID may vary (except for IIR/IIR-M/IIF / and GPS III SVs).

Note 4: For almanac data pages, the SV ID relationship to PRN ID is defined in Table 3-Ia and Table 3-Ib.
40.3.3.5.1.2 Almanac Data. Pages 1 through 24 of subframe 5, as well as pages 2 through 5 and 7 through 9 of subframe 4 contain the almanac data and a SV health word for up to 31 SVs (the health word is discussed in paragraph 40.3.3.5.1.3). The almanac data are a reduced-precision subset of the clock and ephemeris parameters. The data occupy all bits of words three through ten of each page except the eight MSBs of word three (data ID and SV ID), bits 17 through 24 of word five (SV health), and the 50 bits devoted to parity. The number of bits, the scale factor (LSB), the range, and the units of the almanac parameters are given in Table 20-VI. The algorithms and other material related to the use of the almanac data are given in paragraph 40.3.3.5.2.

The almanac message for any dummy SVs shall contain alternating ones and zeros with valid parity.

The almanac parameters shall be updated by the CS at least once every 6 days while the CS is able to upload the SVs. If the CS is unable to upload the SVs, the accuracy of the almanac parameters transmitted by the SVs will degrade over time.

For Block IIA SVs, three sets of almanac shall be used to span at least 60 days. The first and second sets will be transmitted for up to six days each; the third set is intended to be transmitted for the remainder of the 60 days minimum, but the actual duration of transmission will depend on the individual SV’s capability to retain data in memory. All three sets are based on six-day curve fits that correspond to the first six days of the transmission interval. For Block IIR/IIR-M, IIF and GPS III SVs, multiple sets of almanac parameters shall be uploaded to span at least 60 days.

40.3.3.5.1.3 SV Health. Subframes 4 and 5 contain two types of SV health data: (a) each of the 31 pages which contain the clock/ephemeris related almanac data provide an eight-bit SV health status word regarding the SV whose almanac data they carry, and (b) the 25th page of subframe 4 and of subframe 5 jointly contain six-bit health status data for up to 31 SVs.

The three MSBs of the eight-bit health words indicate health of the LNAV data in accordance with the code given in Table 20-VII. The six-bit words provide a one-bit summary of the LNAV data's health status in the MSB position in accordance with paragraph 40.3.3.3.1.4. The five LSBs of both the eight-bit and the six-bit words provide the health status of the SV’s signal components in accordance with the code given in Table 20-VIII. A special meaning is assigned, however, to the "6 ones" combination of the six-bit health words in the 25th page of subframes 4 and 5: it indicates that "the SV which has that ID is not available and there may be no data regarding that SV in that page of subframes 4 and 5 that is assigned to normally contain the almanac data of that SV" (NOTE: this special meaning applies to the 25th page of subframes 4 and 5 only). The health indication shall be given relative to the "as designed" capabilities of each SV (as designated by the configuration code -- see paragraph 40.3.3.5.1.4). Accordingly, any SV which does not have a certain capability will be indicated as "healthy" if the lack of this capability is inherent in its design or it has been configured into a mode which is normal from a user standpoint and does not require that capability.
Additional SV health data are given in subframe 1. The data given in subframes 1, 4, and 5 of the other SVs may differ from that shown in subframes 4 and/or 5 since the latter may be updated at a different time.

The eight-bit health status words shall occupy bits 17 through 24 of word five in those 31 pages which contain almanac data for individual SVs. The six-bit health status words shall occupy the 24 MSBs of words four through nine in page 25 of subframe 5 plus bits 19 through 24 of word 8, the 24 MSBs of word 9, and the 12 MSBs of word 10 in page 25 of subframe 4.

The predicted health data will be updated at the time of upload when a new almanac has been built by the CS. The transmitted health data may not correspond to the actual health of the transmitting SV or other SVs in the constellation.

40.3.3.5.1.4 Anti-Spoof (A-S) Flags and SV Configurations. Page 25 of subframe 4 shall contain a four-bit-long term for each of up to 31 SVs to indicate the A-S status and the configuration code of each SV transmitting with a PRN number in the range of 33 through 63. The MSB of each four-bit term shall be the A-S flag with a "1" indicating that A-S is ON. The three LSBs shall indicate the configuration of each SV using the following code:

<table>
<thead>
<tr>
<th>Code</th>
<th>SV Configuration</th>
</tr>
</thead>
<tbody>
<tr>
<td>000</td>
<td>Reserved</td>
</tr>
<tr>
<td>001</td>
<td>A-S capability, plus flags for A-S and &quot;alert&quot; in HOW; memory capacity as described in paragraph 20.3.2 (e.g. Block II/IIA/IIR SV).</td>
</tr>
<tr>
<td>010</td>
<td>A-S capability, plus flags for A-S and &quot;alert&quot; in HOW; memory capacity as described in paragraph 20.3.2, M-Code signal capability, L2C signal capability (e.g., Block IIR-M SV).</td>
</tr>
<tr>
<td>011</td>
<td>A-S capability, plus flags for A-S and &quot;alert&quot; in HOW; memory capacity as described in paragraph 20.3.2, M-Code capability, L2C signal capability, L5 signal capability (e.g., Block IIF SV).</td>
</tr>
<tr>
<td>100</td>
<td>A-S capability, plus flags for A-S and &quot;alert&quot; in HOW; memory capacity as described in paragraph 20.3.2, M-Code capability, L1C signal capability, L2C signal capability, L5 signal capability, no SA capability (e.g., GPS III SV).</td>
</tr>
</tbody>
</table>

Additional codes will be assigned in the future, should the need arise.

These four-bit terms shall occupy bits 9 through 24 of word three, the 24 MSBs of words four through seven, and the 12 MSBs of word eight, all in page 25 of subframe 4.

Since the anti-spoof information is updated by the CS at the time of upload, the anti-spoof data may not correspond to the actual anti-spoof status of the transmitting SV or other SVs in the constellation.
40.3.3.5.1.5 **Almanac Reference Week.** The almanac reference week shall be as specified in Appendix II, paragraph 20.3.3.5.1.5.

40.3.3.5.1.6 **Coordinated Universal Time (UTC) Parameters.** The UTC parameters shall be as specified in Appendix II, paragraph 20.3.3.5.1.6.

40.3.3.5.1.7 **Ionospheric Data.** The ionospheric data shall be as specified in Appendix II, paragraph 20.3.3.5.1.7.

40.3.3.5.1.8 **Special Messages.** The special messages shall be as specified in Appendix II, paragraph 20.3.3.5.1.8.

40.3.3.5.1.9 **NMCT.** Page 13 of subframe 4 shall contain the NMCT data appropriate to the transmitting SV. Each NMCT contains a two-bit availability indicator (AI) followed by 30 slots which may contain up to 30 valid six-bit ERD values. The layout of these 31 data items is as shown in Figure 40-1.

The two-bit AI in bits 9 and 10 of word three of page 13 of subframe 4 provide the user with the following information.

<table>
<thead>
<tr>
<th>AI</th>
<th>Navigation Message Correction Table Availability</th>
</tr>
</thead>
<tbody>
<tr>
<td>00</td>
<td>The correction table is unencrypted and is available to both precise positioning service users and standard positioning service users.</td>
</tr>
<tr>
<td>01</td>
<td>The correction table is encrypted and is available only to precise positioning service users (normal mode).</td>
</tr>
<tr>
<td>10</td>
<td>No correction table available for either precise positioning service users or standard positioning service users.</td>
</tr>
<tr>
<td>11</td>
<td>Reserved.</td>
</tr>
</tbody>
</table>

Each one of the 30 six-bit ERD slots in bits 11 through 24 of word three, bits 1 through 24 of words four through nine, and bits 1 through 22 of word ten of page 13 of subframe 4 will correspond to an ERD value for a particular SV ID. There are 31 possible SV IDs that these ERD slots may correspond to, ranging from SV ID 65 to SV ID 95. The correspondence between the 30 ERD slots and the 31 possible SV IDs depends on the SV ID of the particular transmitting SV in accordance with the following two rules: 1) the CS shall ensure via upload that no SV shall transmit an NMCT containing an ERD value which applies to its own SV ID, and 2) the CS shall ensure via upload that all ERD values shall be transmitted in ascending numerical slot order of the corresponding SV ID. To illustrate: the SV operating as SV ID 65 will transmit (in order) ERD values which correspond to SV ID 66 through SV ID 95 in ERD slots 1 through 30 respectively, while the SV operating as SV ID 95 will transmit ERD values which correspond to SV ID 65 through SV ID 94 in ERD slots 1 through 30 respectively.
Each ERD value contained in an NMCT ERD slot shall be represented as a six-bit two’s complement field with the sign bit occupying the MSB and an LSB of 0.3 meters for an effective range of ±9.3 m. A binary value of “100000” shall indicate that no valid ERD for the corresponding SV ID is present in that slot.

40.3.3.5.2 Algorithms Related to Subframe 4 and 5 Data. The algorithms related to subframe 4 and 5 data shall be as specified in Appendix II, Section 20.3.3.5.2.

40.3.4 Timing Relationships. The timing relationships shall be as specified in Appendix II, Section 20.3.4.

40.3.5 Data Frame Parity. The data frame parity shall be as specified in Appendix II, Section 20.3.5.
